- Run the job in batch mode without displaying the ANSYS Fluent GUI.
The following is an example of such a batch mode job:

```
job submit /scheduler: head-node-name

/numprocessors:2 /workdir:\file-server\home\user\\
\\head-node\fluent-sharename\ntbin\win64\fluent.exe 3d -t2 -i bs1.jou
```

where `fluent-sharename` is the name of the shared directory pointing to where ANSYS Fluent is installed (for example, `C:\Program Files\ANSYS Inc\v150\fluent`).

**Important**

- Note that you must create a journal file that exits ANSYS Fluent at the end of the run, and refer to it using the `-i` flag in your batch mode job submission (`bs1.jou` in the previous example).
- You can start ANSYS Fluent jobs from any machine on which is installed either the full CCP or the CCP client tools, but note that all the machines must have the same version installed.

### 34.4. Starting Parallel ANSYS Fluent on a Linux System

You can run ANSYS Fluent on a Linux system using either the graphical user interface (For details, see Starting Parallel ANSYS Fluent Using Fluent Launcher (p. 1836)) or command line options (For details, see Starting Parallel ANSYS Fluent on a Linux System Using Command Line Options (p. 1849) and Setting Up Your Remote Shell and Secure Shell Clients (p. 1851)).

For additional information, see the following sections:

- 34.4.1. Starting Parallel ANSYS Fluent on a Linux System Using Command Line Options
- 34.4.2. Setting Up Your Remote Shell and Secure Shell Clients

#### 34.4.1. Starting Parallel ANSYS Fluent on a Linux System Using Command Line Options

To start the parallel version of ANSYS Fluent using command line options, you can use the following syntax in a command prompt window:

```
fluent version -tnprocs [-gpgpu=ngpgpus ] [-pinterconnect ] [-mpi=mpi_type ] -cnf=hosts_file
```

where

- `version` must be replaced by the version of ANSYS Fluent you want to run (2d, 3d, 2ddp, or 3ddp).
- `-pinterconnect` (optional) specifies the type of interconnect. The auto-select interconnect is used by default so that the best available interconnect is used if the option is not explicitly specified. See Table 34.5: Supported Interconnects for Linux Platforms (Per Platform) (p. 1851), Table 34.6: Available MPIs for Linux Platforms (p. 1851), and Table 34.7: Supported MPIs for Linux Architectures (Per Interconnect) (p. 1851) for more information.
• \texttt{-mpi=mpi\_type} (optional) specifies the type of MPI. If the option is not specified, the default MPI for the given interconnect will be used (the use of the default MPI is recommended). The available MPIs for Linux are shown in Table 34.6: Available MPIs for Linux Platforms (p. 1851).

• \texttt{-cnf=hosts\_file} specifies the hosts file, which contains a list of the computers on which you want to run the parallel job. If the hosts file is not located in the directory where you are typing the startup command, you must supply the full pathname to the file.

You can use a plain text editor to create the hosts file. The only restriction on the filename is that there should be no spaces in it. For example, \texttt{hosts.txt} is an acceptable hosts file name, but \texttt{my\_hosts.txt} is not.

Your hosts file (for example, \texttt{hosts.txt}) might contain the following entries:

\begin{verbatim}
computer1
computer2
\end{verbatim}

If a computer in the network is a multiprocessor, you can list it more than once. For example, if \texttt{computer1} has 2 CPUs, then, to take advantage of both CPUs, the \texttt{hosts.txt} file should list \texttt{computer1} twice:

\begin{verbatim}
computer1
computer1
computer2
\end{verbatim}

• \texttt{-t nprocs} specifies the number of processes to use. When the \texttt{-cnf} option is present, the \texttt{hosts\_file} argument is used to determine which computers to use for the parallel job. For example, if there are 10 computers listed in the hosts file and you want to run a job with 5 processes, set \texttt{nprocs} to 5 (that is, \texttt{-t 5}) and ANSYS Fluent will use the first 5 machines listed in the hosts file. Note that if the \texttt{-gpgpu} option is used, \texttt{nprocs} must be chosen such that the number of solver processes per machine is equal on all machines.

• \texttt{-gpgpu=ngpgpus} specifies the number of GPGPUs per machine to use for AMG execution. Note that when this option is used, the number of solver process per machine must be equal on all machines and \texttt{ngpgpus} must be chosen such that the number of solver processes per machine is an integer multiple of \texttt{ngpgpus}. That is, for \texttt{nprocs} solver processes running on \texttt{M} machines using \texttt{ngpgpus} GPGPUS per machine:

\begin{equation}
\frac{nprocs}{M} \mod \frac{ngpgpus}{1} = 0
\end{equation}

See Using General Purpose Graphics Processing Units (GPGPUs) With the Algebraic Multigrid (AMG) Solver (p. 1878) for more information about using GPGPU acceleration.

For example, to use the Infiniband interconnect, and to start the 3D solver with 4 compute nodes on the machines defined in the text file called \texttt{fluent.hosts}, you can enter the following in the command prompt:

\texttt{fluent 3d -t4 -pinfiniband -cnf=fluent.hosts}

Note that if the optional \texttt{-cnf=hosts\_file} is specified, a compute node will be spawned on each machine listed in the file \texttt{hosts\_file}. (If you enter this optional argument, do not include the square brackets.)

Also, ANSYS Fluent provides a fault-tolerance feature on Infiniband Linux clusters running OFED. To invoke this feature, use the command line flag \texttt{-pinfiniband.ofedft (or -pib.ofedft)} which
enables transparent port fail-over and high-availability features using Platform MPI. Note that while the simulations proceed more robustly with this option, there may be some degradation in performance.

The supported interconnects for parallel Linux machines are listed below (Table 34.5: Supported Interconnects for Linux Platforms (Per Platform) (p. 1851), Table 34.6: Available MPIs for Linux Platforms (p. 1851), and Table 34.7: Supported MPIs for Linux Architectures (Per Interconnect) (p. 1851)), along with their associated communication libraries, the corresponding syntax,

Table 34.5: Supported Interconnects for Linux Platforms (Per Platform)

</tbody>
</table>

(*) Both MX and GM Myrinet protocols are supported. ANSYS Fluent will automatically detect which type is running on the system and will use that particular protocol. You only have to supply the -pmyrinet option. If the hardware supports it, the installation and usage of Myrinet MX is recommended (consult your Myrinet vendor for applicability).

(**) The OpenMPI version packaged with ANSYS Fluent does not support Myrinet. However, you can use a local version of OpenMPI with Myrinet support.

34.4.2. Setting Up Your Remote Shell and Secure Shell Clients

For cluster computing on Linux systems, most parallel versions of ANSYS Fluent will require the user account set up such that you can connect to all nodes on the cluster (using either the remote shell (rsh) client or the secure shell (ssh) client) without having to enter a password each time for each machine.
Provided that the appropriate server daemons (either `rshd` or `sshd`) are running, this section briefly describes how you can configure your system in order to use ANSYS Fluent for parallel computing.

### 34.4.2.1. Configuring the `rsh` Client

The remote shell client (`rsh`), is widely deployed and used. It is generally easy to configure, and involves adding all the machine names, each on a single line, to the `.rhosts` file in your home directory.

If you refer to the machine you are currently logged on as the ‘client’, and if you refer to the remote machine to which you seek password-less login as the ‘server’, then on the server, you can add the name of your client machine to the `.rhosts` file. The name could be a local name or a fully qualified name with the domain suffix. Similarly, you can add other clients from which you require similar access to this server. These machines are then “trusted” and remote access is allowed without the further need for a password. This setup assumes you have the same user ID on all the machines. Otherwise, each line in the `.rhosts` file must contain the machine name as well as the user ID for the client that you want access to. Refer to your system documentation for further usage options.

Note that for security purposes, the `.rhosts` file must be readable only by the user.

### 34.4.2.2. Configuring the `ssh` Client

The secure shell client (`ssh`), is a more secure alternative than `rsh` and is also used widely. Depending on the specific protocol and the version deployed, configuration involves a few steps. `SSH1` and `SSH2` are two current protocols. OpenSSH is an open implementation of the `SSH2` protocol and is backwards compatible with the `SSH1` protocol. To add a client machine, with respect to user configuration, the following steps are involved:

1. Generate a public-private key pair using `ssh-keygen` (or using a graphical user interface client). For example:

   ```bash
   % ssh-keygen -t dsa
   ```

   where it creates a Digital Signature Authority (DSA) type key pair.

2. Place your public key on the remote host.
   - For `SSH1`, insert the contents of the client (`~/.ssh/identity.pub`) into the server (`~/.ssh/authorized_keys`).
   - For `SSH2`, insert the contents of the client (`~/.ssh/id_dsa.pub`) into the server (`~/.ssh/authorized_keys2`).

The client machine is now added to the access list and you are no longer required to type in a password each time. For additional information, consult your system administrator or refer to your system documentation.

### 34.5. Mesh Partitioning and Load Balancing

Information about mesh partitioning and load balancing is provided in the following sections:

- **34.5.1. Overview of Mesh Partitioning**
- **34.5.2. Partitioning the Mesh Automatically**
- **34.5.3. Partitioning the Mesh Manually and Balancing the Load**
- **34.5.4. Using the Partitioning and Load Balancing Dialog Box**
- **34.5.5. Mesh Partitioning Methods**
34.5.6. Checking the Partitions
34.5.7. Load Distribution
34.5.8. Troubleshooting

34.5.1. Overview of Mesh Partitioning

When you use the parallel solver in ANSYS Fluent, you must partition or subdivide the mesh into groups of cells that can be solved on separate processors (see Figure 34.6: Partitioning the Mesh (p. 1854)). You can either use the automatic partitioning algorithms when reading an unpartitioned mesh into the parallel solver (recommended approach, described in Partitioning the Mesh Automatically (p. 1854)), or perform the partitioning yourself in the serial solver or after reading a mesh into the parallel solver (as described in Partitioning the Mesh Manually and Balancing the Load (p. 1856)). In either case, the available partitioning methods are those described in Mesh Partitioning Methods (p. 1868). You can partition the mesh before or after you set up the problem (by defining models, boundary conditions, and so on).

Note that the relative distribution of cells among compute nodes will be maintained during mesh adaption, so manual repartitioning after adaption is not required. For details, see Load Distribution (p. 1877).

If you use the serial solver to set up the problem before partitioning, the machine on which you perform this task must have enough memory to read in the mesh. If your mesh is too large to be read into the serial solver, you can read the unpartitioned mesh directly into the parallel solver (using the memory available in all the defined hosts) and have it automatically partitioned. In this case you will set up the problem after an initial partition has been made. You will then be able to manually repartition the case if necessary. See Partitioning the Mesh Automatically (p. 1854) and Partitioning the Mesh Manually and Balancing the Load (p. 1856) for additional details and limitations, and Checking the Partitions (p. 1875) for details about checking the partitions.
34.5.2. Partitioning the Mesh Automatically

For automatic mesh partitioning, you can select the partition method and other options for creating the mesh partitions before reading a case file into the parallel version of the solver. For some of the methods, you can perform pretesting to ensure that the best possible partition is performed. See Mesh Partitioning Methods (p. 1868) for information about the partitioning methods available in ANSYS Fluent.

**Note**

Architecturally aware partitioning (see Partitioning (p. 1856)) is performed automatically when the case file is read. If the maximum inter-machine communication is reduced by more than 5%, the new partition mapping will be applied, and a message is displayed in the console, for example:

```
inter-node communication reduction by architecture-aware remapping: 47%
```
While the message indicates actual point-to-point network traffic reduction, solver computational performance improvement may be somewhat less, and depends on the case and the system network configuration.

The procedure for partitioning automatically in the parallel solver is as follows:

1. (optional) Set the partitioning parameters in the **Auto Partition Mesh** dialog box (Figure 34.7: The Auto Partition Mesh Dialog Box (p. 1855)).

   **Parallel → Auto Partition...**

   **Figure 34.7: The Auto Partition Mesh Dialog Box**

   ![Auto Partition Mesh Dialog Box](image)

   If you are reading in a mesh file or a case file for which no partition information is available, and you keep the **Case File** option turned on, ANSYS Fluent will partition the mesh using the method displayed in the **Method** drop-down list.

   If you want to specify the partitioning method and associated options yourself, the procedure is as follows:

   a. Turn off the **Case File** option. The other options in the dialog box will become available.

   b. Select the partition method in the **Method** drop-down list. The choices are the techniques described in **Partition Methods** (p. 1868).

   c. You can choose to independently apply partitioning to each cell zone, or you can allow partitions to cross zone boundaries using the **Across Zones** check button. It is recommended that you not partition cells zones independently (by turning off the **Across Zones** check button) unless cells in different zones will require significantly different amounts of computation during the solution phase (for example, if the domain contains both solid and fluid zones).

   d. If you have chosen the **Principal Axes** or **Cartesian Axes** method, you can improve the partitioning by enabling the automatic testing of the different bisection directions before the actual partitioning occurs. To use pretesting, turn on the **Pre-Test** option. Pretesting is described in **Pretesting** (p. 1874).

   e. Click **OK**.

   If you have a case file where you have already partitioned the mesh, and the number of partitions divides evenly into the number of compute nodes, you can keep the default selection of **Case File** in the **Auto Partition Mesh** dialog box. This instructs ANSYS Fluent to use the partitions in the case file.

2. Read the case file.
34.5.2.1. Reporting During Auto Partitioning

As the mesh is automatically partitioned, some information about the partitioning process will be displayed in the console. If you want additional information, you can display a report from the Partitioning and Load Balancing dialog box after the partitioning is completed.

34.5.3. Partitioning the Mesh Manually and Balancing the Load

Automatic partitioning in the parallel solver (described in Partitioning the Mesh Automatically (p. 1854)) is the recommended approach to mesh partitioning, but it is also possible to partition the mesh manually in either the serial solver or the parallel solver. After automatic or manual partitioning, you will be able to inspect the partitions created (for details, see Checking the Partitions (p. 1875)) and optionally repartition the mesh, if necessary. Again, you can do so within the serial or the parallel solver, using the Partitioning and Load Balancing dialog box. A partitioned mesh may also be used in the serial solver without any loss in performance.

34.5.3.1. Guidelines for Partitioning the Mesh

The following steps are recommended for partitioning a mesh manually:

1. Partition the mesh using the default method (Metis). Metis will generally produce the best quality partitions for most problems and no further user intervention should be necessary.

2. Examine the partition statistics, which are described in Interpreting Partition Statistics (p. 1875). Your aim is to achieve small magnitudes for Minimum, Maximum, and Total Partition boundary face count ratio while maintaining a balanced load (Mean cell count variation). If the statistics are not acceptable, try one of the other partition methods.

Instructions for manual partitioning are provided below.

34.5.4. Using the Partitioning and Load Balancing Dialog Box

34.5.4.1. Partitioning

In order to partition the mesh, you must select the partition method for creating the mesh partitions, set the number of partitions, select the zones and/or registers, and choose the optimizations to be used. For some methods, you can also perform pretesting to ensure that the best possible partition is performed. Once you have set all the parameters in the Partitioning and Load Balancing dialog box to your satisfaction, click the Partition button to subdivide the mesh into the selected number of partitions using the prescribed method and optimization(s). For recommended partitioning strategies see Guidelines for Partitioning the Mesh (p. 1856).
You can set the relevant inputs in the **Partitioning and Load Balancing** dialog box (Figure 34.8: The Partitioning and Load Balancing Dialog Box in the Parallel Solver (p. 1857) in the parallel solver, or Figure 34.9: The Partitioning and Load Balancing Dialog Box in the Serial Solver (p. 1858) in the serial solver) in the following manner:

**Parallel → Partitioning and Load Balancing...**

**Figure 34.8: The Partitioning and Load Balancing Dialog Box in the Parallel Solver**
1. Select the **Method** from the drop-down list. The choices are described in *Partition Methods* (p. 1868).

2. In the **Options** tab:
   a. Set the desired number of mesh partitions in the **Number of Partitions** field. You can use the counter arrows to increase or decrease the value, instead of typing in the box. The number of mesh partitions must be an integer number that is divisible by the number of processors available for parallel computing.

   b. Set the **Reporting Verbosity**. This allows you to control what is displayed in the console. For details, see *Reporting During Partitioning* (p. 1865).

   c. By default, partitioning will be done across cell zones. You can choose to independently apply partitioning to each cell zone, by disabling **Across Zones**. This is not recommended unless cells in different zones will require significantly different amounts of computation during the solution phase (for example, if the domain contains both solid and fluid zones).

   d. Select the **Reordering Method** for partitions to optimize parallel performance:
      - **Architecture Aware**: This is the default option and it accounts for the system architecture and network topology in remapping the partitions to the processors.
      - **Reverse Cuthill-McKee**: This option minimizes the bandwidth of the compute-node connectivity matrix (the maximum distance between two connected processes) without incorporating the system architecture.
The reordering methods are parallel performance tuning options. After the case is initially partitioned for parallel processing, the partition reordering step will remap the partitions in a more optimal way to improve parallel performance.

---

**Important**

The Architecture-aware reordering method is not applicable when only a single machine is used for the simulation.

---

After initially loading the case into a parallel session, you can click the **Reorder** button to reorder the partitions. The necessary algorithms are executed and ANSYS Fluent will report if it can find a more optimal mapping for the partitions, as well as the potential improvement in inter-machine communications. If the reported improvement is significant (say, more than 5%), then you can click the **Use Stored Partitions** button to use the new partition mapping. This will generally entail large data transfers amongst all the processes, and another reliable method to activate the new partitions would be to write out a case file and load it back in to a new parallel session. The process is similar to re-partitioning with a new partitioning method, for example. Note that sometimes, depending on the cluster configuration and initial case partitioning, and if the partitions have already been reordered, no improvement is possible, and this will be reported in the console after clicking the **Reorder** button. You can simply continue in this case, and there will be no effect on the simulation. Also, note that partition reordering is specific to the current parallel configuration and should be repeated if the number of machines used changes during subsequent computations.

3. In the **Optimization** tab

   a. You can activate and control the desired optimization methods (described in **Optimizations** (p. 1873)). You can activate the **Merge** and **Smooth** schemes by enabling the check button next to each one. For each scheme, you can also set the number of **Iterations**. Each optimization scheme will be applied until appropriate criteria are met, or the maximum number of iterations has been executed. If the **Iterations** counter is set to 0, the optimization scheme will be applied until completion, with no limit on maximum number of iterations.

   b. Choosing the **Principal Axes** or **Cartesian Axes** method, you can improve the partitioning by enabling the automatic testing of the different bisection directions before the actual partitioning occurs. To use pretesting, enable the **Pre-Test** option. Pretesting is described in **Pretesting** (p. 1874).

4. In the **Zones** and/or **Registers** lists, select the zone(s) and/or register(s) for which you want to partition. For most cases, you will select all **Zones** (the default) to partition the entire domain. See below for details.

5. You can assign selected **Zones** and/or **Registers** to a specific partition ID by entering a value for the **Set Selected Zones and Registers to Partition ID**. For example, if the **Number** of partitions for your mesh is 2, then you can only use IDs of 0 or 1. If you have three partitions, then you can enter IDs of 0, 1, or 2. This can be useful in situations where the gradient at a region is known to be high. In such cases, you can mark the region or zone and set the marked cells to one of the partition IDs, thereby preventing the partition from going through that region. This in turn will facilitate convergence. This is also useful in cases where mesh manipulation tools are not available in parallel. In this case, you can assign the related cells to a particular ID so that the mesh manipulation tools are now functional.

If you are running the parallel solver, and you have marked your region and assigned an ID to the selected **Zones** and/or **Registers**, click the **Use Stored Partitions** button to make the new partitions valid.
Refer to the example described later in this section for a demonstration of how selected registers are assigned to a partition (Example of Setting Selected Registers to Specified Partition IDs (p. 1862)).

6. In the **Weighting** tab (Figure 34.10: The Weighting Tab in the Partitioning and Load Balancing Dialog Box for the Parallel Solver (p. 1860)), you can set the appropriate weights, prior to partitioning the mesh, to improve load balancing and overall performance. You can control weights for cells, solid zones, VOF, and DPM. You can either rely on ANSYS Fluent timers to set the weight scaling, or you can specify the value by enabling **User-Specified**.

**Figure 34.10: The Weighting Tab in the Partitioning and Load Balancing Dialog Box for the Parallel Solver**

- **a.** Enable **Faces per Cell** so that the partitioning assigns a weight to each cell based on its number of faces. This type of weighting is advantageous when the case has mixed or polyhedral cell zones. If you enable the **User-Specified** check box, the weight assigned to each cell will be the number of faces plus the **Additional Cell Weight** you enter in the number-entry box under **Value**. By default the **Faces per Cell** weighting is enabled with the **Additional Cell Weight** set to 2.

- **b.** Enable **Solid Zones** weighting to allow the partitioning to take solid zones into consideration. By default, ANSYS Fluent will scale the weight based on the computational time of the solid and fluid zones. If an iteration has not been run, then you may need to specify a value after enabling the user-specified check box. The value you enter is relative to the fluid weight. Typically, it should be less than 1 (for example, 0.0001) so that the calculation will be quicker for the solid zone compared to the fluid zone. Entering a value greater than 1 for the **Solid Zones** means that the calculation will
take longer and will be more computationally expensive for the solid zone compared to the fluid zone.

**Important**

Setting the **Solid Zones** either too high or too low can cause a load imbalance, depending on which equations are being solved. If you are not sure what would be an appropriate value, have ANSYS Fluent automatically set it for you by making sure that **User-Specified** is disabled.

c. Enable **VOF** weighting to allow the partitioning to consider the imbalance caused by the free surface reconstruction with the geo-reconstruct scheme. Therefore, it is only available when using the VOF model with geometric reconstruction. You may use the user-specified value before timers are collected, or if you want to specify a value other than timing statistics. The specified value is the VOF proportion of the total computational effort.

d. Enable **DPM** weighting to set the weight of DPM particles relative to the continuous phase. DPM weights are valid when you have particle tracking in your simulation, where the user-specified value is the DPM proportion of the total computational effort relative to the continuous phase. Note that this is available only when you have injections defined. For details, see **Modeling Discrete Phase** (p. 1131).

The DPM weight takes into account the distribution of the tracking effort over the partitions and it is available after at least one calculation step with particle tracking. Displaying Particle Tracks does not change the weights. The computational effort is determined by the number of DPM steps performed in each cell. This weight becomes more important when the time for the particle tracking of particles exceeds the time for solving the flow. Enabling this option in the **Weighting** tab activates the counting of the particle steps in the cells. These values are available for contour and vector plots when using the **Discrete Phase Model** and **DPM Steps per Cell** variable. After repartitioning, the DPM weights are reset before the next particle tracking. It is generally preferable to partition along the dominant path of the particles in order to minimize particles crossing partition boundaries and thereby reducing associated communication costs. However, partitioning should also consider load balance for the other models, especially the continuous phase, and model weighting provides a means to effectively load balance the overall simulation.

Select the **Hybrid Optimization** option to enable the hybrid optimization partition weighting method for DPM. This method balances the load across machines, and, within each machine, the hybrid parallel DPM method is used to make sure the load is balanced by multi-threading. First, the domain is split based on the model weights of each cell and then partitioned across a number of machines. Finally, each machine is partitioned according to the number of cores. This allows you to have a balanced number of cells in each partition, at the same time having a balanced number of particles on each machine, which will be further balanced by the hybrid DPM method. This optimization option is also applicable to the discrete element method (DEM) collision model.

e. Enable **ISAT** weighting to balance the load during the ISAT table lookup for the stiff-chemistry Laminar, EDC or PDF Transport models. The ISAT algorithm builds an unstructured table in $N$ species dimensions for storage and retrieval of the chemistry mappings. Since chemistry is usually computationally expensive, this storage/retrieval can be very time-consuming (for information about ISAT, refer to **In-Situ Adaptive Tabulation (ISAT)** in the Theory Guide). Each parallel node builds its own table, and there is no message passing to tables on other nodes. As some nodes may have more chemical reactions than others (for example one parallel node may contain just air at a constant temperature, in which case the ISAT table will contain only one entry and calculation will be rapid),
there may be a load imbalance. The dynamic load balancing algorithm will migrate cells from high computational load nodes to low computational load nodes.

If you decide to specify a value, this user-specified value is the ISAT proportion of the total computational effort.

7. When using the dynamic mesh model in your parallel simulations, the **Partition** dialog box includes an **Auto Repartition** option and a **Repartition Interval** setting. These parallel partitioning options are provided because ANSYS Fluent migrates cells when local remeshing and smoothing are performed. Therefore, the partition interface becomes very wrinkled and the load balance may deteriorate. By default, the **Auto Repartition** option is selected, where a percentage of interface faces and loads are automatically traced. When this option is selected, ANSYS Fluent automatically determines the most appropriate repartition interval based on various simulation parameters. Sometimes, using the **Auto Repartition** option provides insufficient results, therefore, the **Repartition Interval** setting can be used. The **Repartition Interval** setting lets you to specify the interval (in time steps or iterations respectively) when a repartition is enforced. When repartitioning is not desired, you can set the **Repartition Interval** to zero.

---

**Important**

Note that when dynamic meshes and local remeshing is utilized, updated meshes may be slightly different in parallel ANSYS Fluent (when compared to serial ANSYS Fluent or when compared to a parallel solution created with a different number of compute nodes), resulting in very small differences in the solutions.

---

8. Click the **Partition** button to partition the mesh.

9. If you decide that the new partitions are better than the previous ones (if the mesh was already partitioned), click the **Use Stored Partitions** button to make the newly stored cell partitions the active cell partitions. The active cell partition is used for the current calculation, while the stored cell partition (the last partition performed) is used when you save a case file.

**34.5.4.1.1. Example of Setting Selected Registers to Specified Partition IDs**

1. Start ANSYS Fluent in parallel. The case in this example was partitioned across two nodes.

2. Read in your case.

3. Display the mesh with the **Partitions** option enabled in the **Mesh Display** dialog box (Figure 34.11: The Partitioned Mesh (p. 1863)).
4. Adapt your region and mark your cells. (For details, see Performing Region Adaption (p. 1556)). This creates a register.

5. Open the Partitioning and Load Balancing dialog box.

6. Set the Set Selected Zones and Registers to Partition ID to 0 and click the corresponding button. This displays the following output in the ANSYS Fluent console:

    >> 2 Active Partitions:
    Collective Partition Statistics: Minimum Maximum Total
    Cell count 459 459 918
    Mean cell count deviation 0.0% 0.0%
    Partition boundary cell count 11 11 22
    Partition boundary cell count ratio 2.4% 2.4% 2.4%
    Face count 764 1714 2461
    Mean face count deviation -38.3% 38.3%
    Partition boundary face count 13 13 17
    Partition boundary face count ratio 0.8% 1.7% 0.7%
    Partition neighbor count 1 1
    Partition Method Metis
    Stored Partition Count 2
    Done.

7. Click the Use Stored Partitions button to make the new partitions valid. This migrates the partitions to the compute-nodes. The following output is then displayed in the ANSYS Fluent console:

    Migrating partitions to compute-nodes.
    >> 2 Active Partitions:
    Collective Partition Statistics: Minimum Maximum Total
    P Cells I-Cells Cell Ratio Faces I-Faces Face Ratio Neighbors
    0 672 24 0.036 2085 29 0.014 1
    1 246 24 0.098 425 29 0.068 1
    Cell count 246 672 918
    Mean cell count deviation -46.4% 46.4%
    Partition boundary cell count 24 24 48
    Partition boundary cell count ratio 3.6% 9.8% 5.2%
    Face count 425 2085 2461
    Mean face count deviation -66.1% 66.1%
    Partition boundary face count 29 29 49
Partition boundary face count ratio  1.4%       6.8%       2.0%
Partition neighbor count            1          1
----------------------------------------------
Partition Method                     Metis
Stored Partition Count               2
Done.

8. Display the mesh (Figure 34.12: The Partitioned ID Set to Zero (p. 1864)).

Figure 34.12: The Partitioned ID Set to Zero

9. This time, set the Set Selected Zones and Registers to Partition ID to 1 and click the corresponding button. This displays a report in the ANSYS Fluent console.

10. Click the Use Stored Partitions button to make the new partitions valid and to migrate the partitions to the compute-nodes.

11. Display the mesh (Figure 34.13: The Partitioned ID Set to 1 (p. 1864)). Notice now that the partition appears in a different location as specified by your partition ID.

Figure 34.13: The Partitioned ID Set to 1

Important

Although this example demonstrates setting selected registers to specific partition IDs in parallel, it can be similarly applied in serial.
34.5.4.1.2. Partitioning Within Zones or Registers

The ability to restrict partitioning to cell zones or registers gives you the flexibility to apply different partitioning strategies to subregions of a domain. For example, if your geometry consists of a cylindrical plenum connected to a rectangular duct, you may want to partition the plenum using the Cylindrical Axes method, and the duct using the Cartesian Axes method.

If the plenum and the duct are contained in two different cell zones, you can select one at a time and perform the desired partitioning, as described in Using the Partitioning and Load Balancing Dialog Box (p. 1856). If they are not in two different cell zones, you can create a cell register (basically a list of cells) for each region using the functions that are used to mark cells for adaption. These functions allow you to mark cells based on physical location, cell volume, gradient or iso value of a particular variable, and other parameters. See Adapting the Mesh (p. 1545) for information about marking cells for adaption. Manipulating Adaption Registers (p. 1564) provides information about manipulating different registers to create new ones. Once you have created a register, you can partition within it as described in Example of Setting Selected Registers to Specified Partition IDs (p. 1862).

**Important**

Note that partitioning within zones or registers is not available when Metis is selected as the partition Method.

For dynamic mesh applications, ANSYS Fluent stores the partition method used to partition the respective zone. Therefore, if repartitioning is done, ANSYS Fluent uses the same method that was used to partition the mesh.

34.5.4.1.3. Reporting During Partitioning

As the mesh is partitioned, information about the partitioning process will be displayed in the console. By default, the number of partitions created, the time required for the partitioning, and the minimum and maximum cell, face, interface, and face-ratio variations will be displayed. (For details, see Interpreting Partition Statistics (p. 1875).) If you increase the Reporting Verbosity to 2 from the default value of 1, the partition method used, the partition ID, number of cells, faces, and interfaces, and the ratio of interfaces to faces for each partition will also be displayed in the console. If you decrease the Reporting Verbosity to 0, only the number of partitions created and the time required for the partitioning will be reported.

You can request a portion of this report to be displayed again after the partitioning is completed. When you click the Print Active Partitions or Print Stored Partitions button in the parallel solver, ANSYS Fluent will display the partition ID, number of cells, faces, and interfaces, and the ratio of interfaces to faces for each active or stored partition in the console. In addition, it will display the minimum and maximum cell, face, interface, and face-ratio variations. In the serial solver, you will obtain the same information about the stored partition when you click Print Partitions. For details, see Interpreting Partition Statistics (p. 1875).

**Important**

Recall that to make the stored cell partitions the active cell partitions you must click the Use Stored Partitions button. The active cell partition is used for the current calculation, while the stored cell partition (the last partition performed) is used when you save a case file.
34.5.4.1.4. Resetting the Partition Parameters

If you change your mind about your partition parameter settings, you can easily return to the default settings assigned by ANSYS Fluent by clicking on the Default button. When you click the Default button, it will become the Reset button. The Reset button allows you to return to the most recently saved settings (that is, the values that were set before you clicked on Default). After execution, the Reset button will become the Default button again.

34.5.4.2. Load Balancing

A dynamic load balancing capability is available in ANSYS Fluent. The principal reason for using parallel processing is to reduce the turnaround time of your simulation, which may be achieved by the following means:

- Faster machines, for example, faster CPU, memory, cache, and communication bandwidth between the CPU and memory
- Faster interconnects, for example, smaller latency and larger bandwidth
- Better Load balancing, for example, load is evenly distributed and CPUs are not idled during calculation

The first two evolve at the pace of computer technology, which is beyond the scope of this document. The third item is regarding optimization of available computation power. Here we are mainly talking about load balancing on dedicated homogeneous resources, which is often the case nowadays. If you are not using a dedicated homogeneous resource, you may need to account for differences in CPU speeds during partitioning by specifying a load distribution. (For details, see Load Distribution (p. 1877)).

On a dedicated homogeneous system, the key for load balancing is how to evaluate the computational requirement of each cell. By default, ANSYS Fluent assumes that each cell requires the same computational work, but this is often not the case. For example

- A hexahedral cell demands more CPU and memory than a tetrahedral cell.
- A cell with particle tracking will use more time than a cell without particle tracking.
- ISAT species model cells may have magnitude differences in time usage.

To balance these differences, ideally, the time used in each cell could be recorded and load balance achieved based on these detailed timing statistics. However, this can be expensive and such low level timings can be unreliable in any case. Instead, we identify features causing computational imbalance and record time usage for these models in aggregate. For a more detailed description of this, refer to Partitioning (p. 1856) in the discussion of the Weighting tab. In addition, the imbalance may happen dynamically during run-time, for example

- The mesh may be changed by adaption or mesh movement.
- In unsteady cases, particle tracking may move from one region to another region.

Dynamic load balancing has been implemented for better scalability of cases with imbalanced physical or geometrical models, thereby reducing the simulation time. The implementation considers weights from these models scaled by CPU time usage. Load balancing for DPM, VOF, cell type (number of faces per cell), and solid zones can be performed. In addition, cell weight based load balancing and machine load distribution can also be specified. (For details, see Load Distribution (p. 1877)). ANSYS Fluent takes the weights from physical models and considers them for partitioning. The weights are assembled based...
on the time used by each physical model. For dynamic load balancing, the load is checked and balanced based on your specified imbalance threshold. To apply dynamic load balancing on the various models, click the **Dynamic Load Balancing** tab and select the required balancing as follows:

**Figure 34.14: The Dynamic Load Balancing Tab**

1. Enable **Physical Models** load balancing during iterations so that the load will be evaluated for time usage and weight distribution, based on the **Interval** that you provide. If the imbalance exceeds the specified **Threshold**, then repartitioning will be performed by considering the selected weights. **Physical Models** load balancing will only be available when you have the specific physical models enabled in the case. You will be prompted to enable the weights for those models. When weights for the physical models are all disabled, you will be prompted to disable **Physical Models** load balancing.

   **Note**

   Applying load balancing too frequently may cause performance degradation due to the additional cost of migrating cells for the new partition layout.

2. Enable **Dynamic Mesh** if there is any dynamic mesh movement. Load balancing, based on the number of cells, will be checked and balanced if the imbalance threshold is exceeded. These parallel partitioning options are provided because with mesh motion, local remeshing and smoothing are performed, the partition interface can become very wrinkled and load balance may deteriorate. By default, the **Auto** option is selected, where a percentage of interface faces and loads are automatically traced. When this option is selected, ANSYS Fluent automatically determines the most appropriate repartitioning interval based on various simulation parameters. However, sometimes, the frequency of load balancing from the **Auto** option may be inadequate, and then the **Interval** setting can be explicitly set. The **Interval** setting lets you specify the interval (in time steps or iterations, respectively) when load balancing is enforced.
When load balancing is not desired, you may disable **Dynamic Mesh** load balancing. Dynamic Mesh load balancing is only available when you have dynamic models enabled in your case.

---

**Important**

Note that when dynamic meshes and local remeshing are utilized, updated meshes may be slightly different in parallel ANSYS Fluent (when compared to serial ANSYS Fluent or when compared to a parallel solution created with a different number of compute nodes), resulting in very small differences in the solutions.

---

3. Enable **Mesh Adaption**. Any time mesh adaption occurs, load balancing, based on the number of cells, will be checked and balanced if the imbalance threshold is exceeded. If problems arise in your computations due to adaption, you can disable the load balancing for **Mesh Adaption**.

### 34.5.5. Mesh Partitioning Methods

Partitioning the mesh for parallel processing has three major goals:

- Create partitions with equal numbers of cells.
- Minimize the number of partition interfaces — that is, decrease partition boundary surface area.
- Minimize the number of partition neighbors.

Balancing the partitions (equalizing the number of cells) ensures that each processor has an equal load and that the partitions will be ready to communicate at about the same time. Since communication between partitions can be a relatively time-consuming process, minimizing the number of interfaces can reduce the time associated with this data interchange. Minimizing the number of partition neighbors reduces the chances for network and routing contentions. In addition, minimizing partition neighbors is important on machines where the cost of initiating message passing is expensive compared to the cost of sending longer messages. This is especially true for workstations connected in a network.

The partitioning schemes in ANSYS Fluent use bisection or METIS algorithms to create the partitions, but unlike other schemes that require the number of partitions to be a factor of two, these schemes have no limitations on the number of partitions. You will create as many partitions as there are computing units (cores based on processors and machines) available for your simulation.

#### 34.5.5.1. Partition Methods

The mesh is partitioned using a bisection or METIS algorithm. The selected algorithm is applied to the parent domain, and then recursively applied to the subdomains. For example, to divide the mesh into four partitions with a bisection method, Fluent will bisect the entire (parent) domain into two child domains, and then repeat the bisection for each of the child domains, yielding four partitions in total. To divide the mesh into three partitions with a bisection method, Fluent will “bisect” the parent domain to create two partitions—one approximately twice as large as the other—and then bisect the larger child domain again to create three partitions in total. METIS uses graph partitioning techniques that generally provide more optimal partitions than the geometric methods.

The mesh can be partitioned using one of the algorithms listed below. The most efficient choice is problem-dependent, so you can try different methods until you find the one that is best for your problem. See **Guidelines for Partitioning the Mesh (p. 1856)** for recommended partitioning strategies.
**Cartesian Axes**

bisects the domain based on the Cartesian coordinates of the cells (see Figure 34.15: Partitions Created with the Cartesian Axes Method (p. 1870)). It bisects the parent domain and all subsequent child subdomains perpendicular to the coordinate direction with the longest extent of the active domain. It is often referred to as coordinate bisection.

**Cartesian Strip**

uses coordinate bisection but restricts all bisections to the Cartesian direction of longest extent of the parent domain (see Figure 34.16: Partitions Created with the Cartesian Strip or Cartesian X-Coordinate Method (p. 1871)). You can often minimize the number of partition neighbors using this approach.

**Cartesian X-, Y-, Z-Coordinate**

bisects the domain based on the selected Cartesian coordinate. It bisects the parent domain and all subsequent child subdomains perpendicular to the specified coordinate direction. (See Figure 34.16: Partitions Created with the Cartesian Strip or Cartesian X-Coordinate Method (p. 1871).)

**Cartesian R Axes**

bisects the domain based on the shortest radial distance from the cell centers to that Cartesian axis (x, y, or z) whichever produces the smallest interface size. This method is available only in 3D.

**Cartesian RX-, RY-, RZ-Coordinate**

bisects the domain based on the shortest radial distance from the cell centers to the selected Cartesian axis (x, y, or z). These methods are available only in 3D.

**Cylindrical Axes**

bisects the domain based on the cylindrical coordinates of the cells. This method is available only in 3D.

**Cylindrical R-, Theta-, Z-Coordinate**

bisects the domain based on the selected cylindrical coordinate. These methods are available only in 3D.

**Metis**

uses the METIS software package for partitioning irregular graphs, developed by Karypis and Kumar at the University of Minnesota and the Army HPC Research Center. It uses a multilevel approach in which the vertices and edges on the fine graph are coalesced to form a coarse graph. The coarse graph is partitioned, and then uncoarsened back to the original graph. During coarsening and uncoarsening, algorithms are applied to permit high-quality partitions. Detailed information about METIS can be found in its manual [42] (p. 2559).

---

**Important**

If you create non-conformal interfaces, and generate virtual polygonal faces, your METIS partition can cross non-conformal interfaces by using the connectivity of the virtual polygonal faces. This improves load balancing for the parallel solver and minimizes communication by decreasing the number of partition interface cells.

**Polar Axes**

bisects the domain based on the polar coordinates of the cells (see Figure 34.19: Partitions Created with the Polar Axes or Polar Theta-Coordinate Method (p. 1872)). This method is available only in 2D.

**Polar R-Coordinate, Polar Theta-Coordinate**

bisects the domain based on the selected polar coordinate (see Figure 34.19: Partitions Created with the Polar Axes or Polar Theta-Coordinate Method (p. 1872)). These methods are available only in 2D.
**Principal Axes**

bisects the domain based on a coordinate frame aligned with the principal axes of the domain (see Figure 34.17: Partitions Created with the Principal Axes Method (p. 1871)). This reduces to Cartesian bisection when the principal axes are aligned with the Cartesian axes. The algorithm is also referred to as moment, inertial, or moment-of-inertia partitioning.

This is the default bisection method in ANSYS Fluent.

**Principal Strip**

uses moment bisection but restricts all bisections to the principal axis of longest extent of the parent domain (see Figure 34.18: Partitions Created with the Principal Strip or Principal X-Coordinate Method (p. 1872)). You can often minimize the number of partition neighbors using this approach.

**Principal X-, Y-, Z-Coordinate**

bisects the domain based on the selected principal coordinate (see Figure 34.18: Partitions Created with the Principal Strip or Principal X-Coordinate Method (p. 1872)).

**Spherical Axes**

bisects the domain based on the spherical coordinates of the cells. This method is available only in 3D.

**Spherical Rho-, Theta-, Phi-Coordinate**

bisects the domain based on the selected spherical coordinate. These methods are available only in 3D.
Figure 34.16: Partitions Created with the Cartesian Strip or Cartesian X-Coordinate Method

Figure 34.17: Partitions Created with the Principal Axes Method
For cases with highly stretched cells, convergence may be difficult to achieve if the partition interface goes through the highly stretched areas. For such cases, cell geometry information is taken into consideration during partitioning with Metis. To assist in cases such as these, use the parallel/partition/set/stretched-mesh-enhancement text interface command (serial partition only).

For certain cases, you may want to extrude the partition from specific face zones. Essentially, ANSYS Fluent will partition the cells attached to the selected face zones first, then extrude
the partitions to the other cells. This can be achieved using the parallel/partition/set/layering text interface command (serial partition only). The layering method is only intended for meshes with a clear extruding direction, layer by layer in topology.

### 34.5.5.2. Optimizations

Additional optimizations can be applied to improve the quality of the mesh partitions. The heuristic of bisecting perpendicular to the direction of longest domain extent is not always the best choice for creating the smallest interface boundary. A pre-testing operation, (For details, see Pretesting (p. 1874)) can be applied to automatically choose the best direction before partitioning. In addition, the following iterative optimization schemes exist:

**Smooth**
- Attempts to minimize the number of partition interfaces by swapping cells between partitions. The scheme traverses the partition boundary and gives cells to the neighboring partition if the interface boundary surface area is decreased. (See Figure 34.20: The Smooth Optimization Scheme (p. 1873).)

**Merge**
- Attempts to eliminate orphan clusters from each partition. An orphan cluster is a group of cells with the common feature that each cell within the group has at least one face that coincides with an interface boundary. (See Figure 34.21: The Merge Optimization Scheme (p. 1873).) Orphan clusters can degrade multigrid performance and lead to large communication costs.

![Figure 34.20: The Smooth Optimization Scheme](image)

![Figure 34.21: The Merge Optimization Scheme](image)

In general, the Smooth and Merge schemes are relatively inexpensive optimization tools.
34.5.5.3. Pretesting

If you choose the **Principal Axes** or **Cartesian Axes** method, you can improve the bisection by testing different directions before performing the actual bisection. If you choose not to use pretesting (the default), ANSYS Fluent will perform the bisection perpendicular to the direction of longest domain extent.

If pretesting is enabled, it will occur automatically when you click the **Partition** button in the **Partitioning and Load Balancing Dialog Box (p. 2508)**, or when you read in the mesh if you are using automatic partitioning. The bisection algorithm will test all coordinate directions and choose the one which yields the fewest partition interfaces for the final bisection.

Note that using pretesting will increase the time required for partitioning. For 2D problems partitioning will take 3 times longer than without pretesting, and for 3D problems it will take 4 times longer.

34.5.5.4. Using the Partition Filter

As noted above, you can use the METIS partitioning method through a filter in addition to within the **Auto Partition Mesh** and **Partitioning and Load Balancing** dialog boxes. To perform METIS partitioning on an unpartitioned mesh, use the **File/Import/Partition/Metis...** menu item.

File → Import → Partition → Metis...

ANSYS Fluent will use the METIS partitioner to partition the mesh, and then read the partitioned mesh. The number of partitions will be equal to the number of processes. You can then proceed with the model definition and solution.

---

**Important**

Direct import to the parallel solver through the partition filter requires that the host machine has enough memory to run the filter for the specified mesh. If not, you must run the filter on a machine that does have enough memory. You can either start the parallel solver on the machine with enough memory and repeat the process described above, or run the filter manually on the new machine and then read the partitioned mesh into the parallel solver on the host machine.

To manually partition a mesh using the partition filter, enter the following command:

```
utility partition input_filename partition_count output_filename
```

where **input_filename** is the filename for the mesh to be partitioned, **partition_count** is the number of partitions desired, and **output_filename** is the filename for the partitioned mesh. You can then read the partitioned mesh into Fluent (using the standard **File/Read/Case...** menu item) and proceed with the model definition and solution.

When the **File/Import/Partition/Metis...** menu item is used to import an unpartitioned mesh into the parallel solver, the METIS partitioner partitions the entire mesh. You may also partition each cell zone individually, using the **File/Import/Partition/Metis Zone...** menu item.

File → Import → Partition → Metis Zone...

This method can be useful for balancing the work load. For example, if a case has a fluid zone and a solid zone, the computation in the fluid zone is more expensive than in the solid zone, so partitioning each zone individually will result in a more balanced work load.
34.5.6. Checking the Partitions

After partitioning a mesh, you should check the partition information and examine the partitions graphically.

34.5.6.1. Interpreting Partition Statistics

You can request a report to be displayed after partitioning (either automatic or manual) is completed. In the parallel solver, click the Print Active Partitions or Print Stored Partitions button in the Partitioning and Load Balancing dialog box. In the serial solver, click the Print Partitions button.

ANSYS Fluent distinguishes between two cell partition schemes within a parallel problem: the active cell partitions and the stored cell partitions. Initially, both are set to the cell partitions that were established upon reading the case file. If you re-partition the mesh using the Partitioning and Load Balancing dialog box, the new partitions will be referred to as the stored cell partitions. To make them the active cell partitions, you must click the Use Stored Partitions button in the Partitioning and Load Balancing dialog box. The active cell partitions are used for the current calculation, while the stored cell partitions (determined from the last partitioning performed) are used when you save a case file. This distinction is made mainly to allow you to partition a case on one machine or network of machines and solve it on a different one. Thanks to the two separate partitioning schemes, you could use the parallel solver with a certain number of compute nodes to subdivide a mesh into an arbitrary different number of partitions, suitable for a different parallel machine, save the case file, and then load it into the designated machine.

When you click Print Partitions in the serial solver, you will obtain information about the stored partitions.

The output generated when you print the partitions consists of tabulated information about the active or stored partitioning scheme. A typical output for a mesh with 4 partitions is as follows:

```
>> 4 Active Partitions:
P   Cells I-Cells Cell Ratio   Faces I-Faces Face Ratio Neighbors Load
0    3520     142      0.040   11399     195      0.017         1    1
1    3298     115      0.035   10678     151      0.014         1    1
2    3451     305      0.088   11404     372      0.033         2    1
3    3583     332      0.093   11586     416      0.036         2    1

Collective Partition Statistics:        Minimum   Maximum   Total
----------------------------------------------------------
Cell count                              3298      3583      13852
Mean cell count deviation               -4.8%     3.5%
Partition boundary cell count           115       332       894
Partition boundary cell count ratio     3.5%      9.3%      6.5%
Face count                              10678     11586     44500
Mean face count deviation               -5.2%     2.8%
Partition boundary face count           151       416       567
Partition boundary face count ratio     1.4%      3.6%      1.3%
Partition neighbor count                1         2
----------------------------------------------------------
Partition Method                        Metis
Stored Partition Count                  4

Done.
```

The first table in the output displays per-partition statistics of interest:

P

the partition number
Cells
the number of cells in the partition

I-Cells
the number of interface cells in the partition (that is, cells that lie on the partition interfaces)

Cell Ratio
the ratio of interface cells to total cells for the partition

Faces
the number of faces in the partition

I-Faces
the number of interface faces in the partition (that is, faces that lie on partition interfaces)

Face Ratio
the ratio of interface faces to total faces for the partition

Neighbors
the number of neighbor partitions

Load
the desired relative load on this node in proportion to the other nodes. See Load Distribution (p. 1877) for details.

The second table in the output displays Minimum, Maximum, and (where applicable) Total values for various partition statistics:

Cell Count
the number of cells in the partitions (corresponding to Cells in the per-partition table)

Mean cell count deviation
the deviation of an individual partition cell count from the mean partition cell count

Partition boundary cell count
the number of cells that lie on partition interfaces (corresponding to I-Cells in the per-partition table)

Partition boundary cell count ratio
the ratio of the number of cells that lie on partition interfaces to the total number of cells in the partition (corresponding to Cell Ratio in the per-partition table)

Face Count
the number of faces in the partitions (corresponding to Faces in the per-partition table)

Mean face count deviation
the deviation of an individual partition face count from the mean partition face count

Partition boundary face count
the number of faces that lie on partition interfaces (corresponding to I-Faces in the per-partition table)

Partition boundary face count ratio
the ratio of the number of faces that lie on partition interfaces to the total number of faces in the partition (corresponding to Face Ratio in the per-partition table)
**Partition neighbor count**

the number of neighbors for a given partition (corresponding to Neighbors in the per-partition table)

Finally, the **Partition Method** and **Stored Partition Count** are displayed.

Your aim is to achieve small magnitudes for **Minimum**, **Maximum**, and **Total Partition boundary face count ratio** while maintaining a balanced load (Mean cell count variation).

Note that partition IDs correspond directly to compute node IDs when a case file is read into the parallel solver. When the number of partitions in a case file is larger than the number of compute nodes, but is evenly divisible by the number of compute nodes, then the distribution is such that partitions with IDs 0 to \((M - 1)\) are mapped onto compute node 0, partitions with IDs \(M\) to \((2M - 1)\) onto compute node 1, and so on, where \(M\) is equal to the ratio of the number of partitions to the number of compute nodes.

### 34.5.6.2. Examining Partitions Graphically

To further aid interpretation of the partition information, you can draw contours of the mesh partitions, as illustrated in

**(Graphics and Animations → Contours → Set Up...)**

To display the active cell partition or the stored cell partition (which were described above), select **Active Cell Partition** or **Stored Cell Partition** in the **Cell Info...** category of the **Contours Of** drop-down list, and turn off the display of **Node Values**. (For details, see **Displaying Contours and Profiles (p. 1612)** for information about displaying contours.)

**Important**

If you have not already done so in the setup of your problem, you must perform a solution initialization in order to use the **Contours** dialog box.

### 34.5.7. Load Distribution

If the speeds of the processors that will be used for a parallel calculation differ significantly, you can specify a load distribution for partitioning, using the **load-distribution** text command.

**parallel → partition → set → load-distribution**

For example, if you will be solving on three compute nodes, and one machine is twice as fast as the other two, then you may want to assign twice as many cells to the first machine as to the others (that is, a load vector of \((2 1 1)\)). During subsequent mesh partitioning, partition 0 will end up with twice as many cells as partitions 1 and 2.

For this example, you need to start up ANSYS Fluent such that compute node 0 is the fast machine, since partition 0, with twice as many cells as the others, will be mapped onto compute node 0. Alternatively, in this situation, you could enable the load balancing feature (described in **Load Balancing (p. 1866)**) to have ANSYS Fluent automatically attempt to discern any difference in load among the compute nodes.
34.5.8. Troubleshooting

When running a calculation using parallel ANSYS Fluent, you may encounter a warning message in the console that reports problems related to the partitioning. The following is an example of such a warning:

```
#AMG# Warning: The global matrix size (1273286) is too large, and may adversely affect the parallel performance. See the ANSYS Fluent User's Guide for information on troubleshooting partitioning issues.
```

The following are possible reasons why the global matrix size is so large, along with recommendations for reducing it:

- The presence of solid zones may cause a partition to have a very small amount of fluid cells. For such cases, it is recommended that you partition the mesh with the Across Zones option disabled in the Partitioning and Load Balancing dialog box, and then click the Use Stored Partitions button.

- A partition may have a small number of cells if you have set up a load distribution for partitioning. Such settings should be disabled, by using the load-distribution text command (described in Load Distribution (p. 1877)) and entering a value of 1 for each of the previously defined partitions.

- Some model settings (for example, shell conduction) can encapsulate some cells, which may cause difficulties with the coarsening process. To remedy this situation, you can either try a different partitioning method, or you can enable the global coarsening checking criteria with the following rpvar setting:

  
  (rpsetvar 'amg/parallel/global-check-coarsening? #t)

34.6. Using General Purpose Graphics Processing Units (GPGPUs) With the Algebraic Multigrid (AMG) Solver

You can accelerate the Algebraic Multigrid (AMG) solver inside Fluent using General Purpose Graphics Processing Units (GPGPUs) if suitable hardware is available on your compute machines. When enabled, you can use GPGPU acceleration for AMG computations in a parallel Fluent session on linear systems of block sizes up to 5x5. Using GPGPUs requires Neutral Parallel licenses. One Neutral Parallel license is checked out for each solver process and for each GPGPU. Thus, if 8 processes are spawned on a single machine using 2 GPGPUs, a total of 10 neutral parallel licenses are checked out. If 8 processes are spawned using 2 machines and 2 GPGPUs per machine, a total of 12 neutral parallel licenses are checked out.

34.6.1. Requirements

The following requirements must be satisfied in order to use this functionality:

- The machines must be equipped with NVIDIA Fermi or later GPGPUs.

- CUDA 5.0 and the required driver must be installed.

- The compute platform must be either Inamd64 (SLES11 and above, RHEL 5.4 and above) or win64 (Windows 7 and above).

In addition, when starting the parallel Fluent session the following conditions must be met:

- The number of solver processes per machine must be equal on all machines.

- The number solver processes per machine must be evenly divisible by the specified number of GPGPUs per machine.
34.6.2. Limitations

GPGPU acceleration is subject to the following limitations:

- When using Fluent in Workbench, the number of GPGPUs cannot be set through:
  - Properties of Setup Cells
  - Properties of Solution Cells
  - Properties of Solution Cells through RSM update
  - Properties of Parameter Sets through RSM update

- GPGPU acceleration will not be used in the following cases:
  - Population balance model is active
  - Eulerian multiphase model is active
  - The system has a block size greater than 5x5

34.6.3. Using and Managing GPGPUs

In order to use GPGPUs, you must specify in the Fluent Launcher or with the -gpgpu=ngpgpus command line option how many GPGPUs are to be used per machine. For details, refer to the following sections:

- Starting Parallel ANSYS Fluent Using Fluent Launcher (p. 1836)
- Starting Parallel ANSYS Fluent on a Windows System Using Command Line Options (p. 1844)
- Starting Parallel ANSYS Fluent on a Linux System (p. 1849)

Once the Fluent session is running, you can view and/or select the available GPGPUs on the system using the following TUI commands:

- parallel/gpgpu/show
display the available GPGPUs on the system.

- parallel/gpgpu/select
  select the GPGPUs to use. Note that you can only select up to the number of GPGPUs that you specified on the command line or in the Fluent Launcher when starting the session.

By default, GPGPU acceleration is applied automatically to coupled systems and not to scalar systems because scalar systems typically are not as computationally expensive. However, if desired you can enable/disable GPGPU acceleration of the AMG solver for coupled and scalar systems using the following TUI command:

- solve/set/amg-options/amg-gpgpu-execution

34.7. Controlling the Threads

You can control the maximum number of threads on each machine by using the Thread Control dialog box (Figure 34.23: The Parallel Connectivity Dialog Box (p. 1881)).

Parallel → Thread Control...
You have the following options when using the Thread Control dialog box:

- **Number of Node Processes on Machine**
  
  This is the default option. When this option is chosen, the maximum number of threads on each machine is equal to the number of ANSYS Fluent node processes on each machine.

- **Number of Cores on Machine**
  
  When this option is chosen, the maximum number of threads on each machine is equal to the number of cores on the machine. ANSYS Fluent obtains the number of cores from the OS. This may be applicable when the multi-threaded part of the calculation is dominating the computation time, and the continuous phase calculation is relatively small, and you want to take full advantage of the computation resources. For example, if you have a very small case with regard to the number of cells, but a large number of particles to be tracked, you may want to spawn one ANSYS Fluent node process on each machine, but use the maximum number of cores in order to get a good overall performance.

- **Fixed Number**
  
  When this option is chosen, you may input the maximum number of threads that can be spawned on each machine in the number-entry box below Fixed Number. This may only be applicable when you want to have fine control of the number of threads on each machine; it is not recommended in general.

### 34.8. Checking Network Connectivity

For any compute node, you can print network connectivity information that includes the hostname, architecture, process ID, and ID of the selected compute node and all machines connected to it. The ID of the selected compute node is marked with an asterisk.

The ID for the ANSYS Fluent host process is always host. The compute nodes are numbered sequentially starting from node-0. All compute nodes are completely connected. In addition, compute node 0 is connected to the host process.

To obtain connectivity information for a compute node, you can use the Parallel Connectivity Dialog Box (p. 2517) (Figure 34.23: The Parallel Connectivity Dialog Box (p. 1881)).

**Parallel → Network → Show Connectivity...**
Indicate the compute node ID for which connectivity information is desired in the **Compute Node** field, and then click the **Print** button. Sample output for compute node 0 is shown below:

<table>
<thead>
<tr>
<th>ID</th>
<th>Comm.</th>
<th>Hostname</th>
<th>O.S.</th>
<th>PID</th>
<th>Mach ID</th>
<th>HW ID</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>host</td>
<td>pcmpi</td>
<td>balin</td>
<td>Linux-32</td>
<td>17272</td>
<td>0</td>
<td>7</td>
<td>Fluent Host</td>
</tr>
<tr>
<td>n3</td>
<td>pcmpi</td>
<td>balin</td>
<td>Linux-32</td>
<td>17307</td>
<td>10</td>
<td>Fluent Node</td>
<td></td>
</tr>
<tr>
<td>n2</td>
<td>pcmpi</td>
<td>filio</td>
<td>Linux-32</td>
<td>17306</td>
<td>0</td>
<td>1</td>
<td>Fluent Node</td>
</tr>
<tr>
<td>n1</td>
<td>pcmpi</td>
<td>bofur</td>
<td>Linux-32</td>
<td>17305</td>
<td>1</td>
<td>Fluent Node</td>
<td></td>
</tr>
<tr>
<td>n0*</td>
<td>pcmpi</td>
<td>balin</td>
<td>Linux-32</td>
<td>17273</td>
<td>2</td>
<td>1</td>
<td>Fluent Node</td>
</tr>
</tbody>
</table>

O.S is the architecture, Comm. is the communication library (that is, MPI type), PID is the process ID number, Mach ID is the compute node ID, and HW ID is an identifier specific to the interconnect used.

### 34.9. Checking and Improving Parallel Performance

To determine how well the parallel solver is working, you can measure computation and communication times, and the overall parallel efficiency, using the performance meter. You can also control the amount of communication between compute nodes in order to optimize the parallel solver, and take advantage of the automatic load balancing feature of ANSYS Fluent.

Information about checking and improving parallel performance is provided in the following sections:

- **34.9.1. Checking Parallel Performance**
- **34.9.2. Optimizing the Parallel Solver**

#### 34.9.1. Checking Parallel Performance

The performance meter allows you to report the wall clock time elapsed during a computation, as well as message-passing statistics. Since the performance meter is always activated, you can access the statistics by displaying them after the computation is completed. To view the current statistics, use the **Parallel/Timer/Usage** menu item.

**Parallel → Timer → Usage**

Performance statistics will be displayed in the console.

To clear the performance meter so that you can eliminate past statistics from the future report, use the **Parallel/Timer/Reset** menu item.

**Parallel → Timer → Reset**

The following example demonstrates how the current parallel statistics are displayed in the console:

```
Performance Timer for 1 iterations on 4 compute nodes
Average wall-clock time per iteration:        4.901 sec
Global reductions per iteration:             408 ops
```
Global reductions time per iteration: 0.000 sec (0.0%)
Message count per iteration: 801 messages
Data transfer per iteration: 9.585 MB
LE solves per iteration: 12 solves
LE wall-clock time per iteration: 2.445 sec (49.9%)
LE global solves per iteration: 27 solves
LE global wall-clock time per iteration: 0.246 sec (5.0%)
AMG cycles per iteration: 64 cycles
Relaxation sweeps per iteration: 4160 sweeps
Relaxation exchanges per iteration: 920 exchanges
Total wall-clock time: 4.901 sec
Total CPU time: 17.030 sec

A description of the parallel statistics is as follows:

• **Average wall-clock time per iteration** describes the average real (wall clock) time per iteration.

• **Global reductions per iteration** describes the number of global reduction operations (such as variable summations over all processes). This requires communication among all processes.

  A global reduction is a collective operation over all processes for the given job that reduces a vector quantity (the length given by the number of processes or nodes) to a scalar quantity (for example, taking the sum or maximum of a particular quantity). The number of global reductions cannot be calculated from any other readily known quantities. The number is generally dependent on the algorithm being used and the problem being solved.

• **Global reductions time per iteration** describes the time per iteration for the global reduction operations.

• **Message count per iteration** describes the number of messages sent between all processes per iteration. This is important with regard to communication latency, especially on high-latency interconnects.

  A message is defined as a single point-to-point, send-and-receive operation between any two processes. This excludes global, collective operations such as global reductions. In terms of domain decomposition, a message is passed from the process governing one subdomain to a process governing another (usually adjacent) subdomain.

  The message count per iteration is usually dependent on the algorithm being used and the problem being solved. The message count and the number of messages that are reported are totals for all processors.

  The message count provides some insight into the impact of communication latency on parallel performance. A higher message count indicates that the parallel performance may be more adversely affected if a high-latency interconnect is being used. Ethernet has a higher latency than Myrinet or Infiniband. Therefore, a high message count will more adversely affect performance with Ethernet than with Infiniband.

  To check the latency of the overall cluster interconnect, refer to Checking Latency and Bandwidth (p. 1884).

• **Data transfer per iteration** describes the amount of data communicated between processors per iteration. This is important with respect to interconnect bandwidth.

  Data transfer per iteration is usually dependent on the algorithm being used and the problem being solved. This number generally increases with increases in problem size, number of partitions, and physics complexity.
The data transfer per iteration may provide some insight into the impact of communication bandwidth (speed) on parallel performance. The precise impact is often difficult to quantify because it is dependent on many things including: ratio of data transfer to calculations, and ratio of communication bandwidth to CPU speed. The unit of data transfer is a byte.

To check the bandwidth of the overall cluster interconnect, refer to Checking Latency and Bandwidth (p. 1884).

- **LE solves per iteration** describes the number of linear systems being solved per iteration. This number is dependent on the physics (non-reacting versus reacting flow) and the algorithms (pressure-based versus density-based solver), but is independent of mesh size. For the pressure-based solver, this is usually the number of transport equations being solved (mass, momentum, energy, and so on).

- **LE wall-clock time per iteration** describes the time (wall-clock) spent doing linear equation solvers (that is, multigrid).

- **LE global solves per iteration** describes the number of solutions on the coarsest level of the AMG solver where the entire linear system has been pushed to a single processor ($n_0$). The system is pushed to a single processor to reduce the computation time during the solution on that level. Scaling generally is not adversely affected because the number of unknowns is small on the coarser levels.

- **LE global wall-clock time per iteration** describes the time (wall-clock) per iteration for the linear equation global solutions.

- **AMG cycles per iteration** describes the average number of multigrid cycles ($V, W$, flexible, and so on) per iteration.

- **Relaxation sweeps per iteration** describes the number of relaxation sweeps (or iterative solutions) on all levels for all equations per iteration. A relaxation sweep is usually one iteration of Gauss-Siedel or ILU.

- **Relaxation exchanges per iteration** describes the number of solution communications between processors during the relaxation process in AMG. This number may be less than the number of sweeps because of shifting the linear system on coarser levels to a single node/process.

- **Time-step updates per iteration** describes the number of sub-iterations on the time step per iteration.

- **Time-step wall-clock time per iteration** describes the time per sub-iteration.

- **Total wall-clock time** describes the total wall-clock time.

- **Total CPU time** describes the total CPU time used by all processes. This does not include any wait time for load imbalances or for communications (other than packing and unpacking local buffers).

The most relevant quantity is the **Total wall clock time**. This quantity can be used to gauge the parallel performance (speedup and efficiency) by comparing this quantity to that from the serial analysis (the command line should contain `-t1` in order to obtain the statistics from a serial analysis). In lieu of a serial analysis, an approximation of parallel speedup may be found in the ratio of Total CPU time to Total wall clock time.
### 34.9.1.1. Checking Latency and Bandwidth

You can check the latency and bandwidth of the overall cluster interconnect, to help identify any issues affecting ANSYS Fluent scalability, by using the **Parallel/Network/Show Latency...** and **Parallel/Network/Show Bandwidth...** menu items.

**Parallel → Network → Show Latency...**

Depending on the number of machines and processors being used, a table containing information about the communication speed for each node will be displayed in the console. The table will also summarize the minimum and maximum latency between two nodes.

Consider the following example when checking for latency:

<table>
<thead>
<tr>
<th>ID</th>
<th>n0</th>
<th>n1</th>
<th>n2</th>
<th>n3</th>
<th>n4</th>
<th>n5</th>
</tr>
</thead>
<tbody>
<tr>
<td>n0</td>
<td>48.0</td>
<td>48.2</td>
<td>48.2</td>
<td>48.3</td>
<td>*50</td>
<td></td>
</tr>
<tr>
<td>n1</td>
<td>48.2</td>
<td>48.2</td>
<td>48.8</td>
<td>49.1</td>
<td>*53</td>
<td></td>
</tr>
<tr>
<td>n2</td>
<td>48.2</td>
<td>48.3</td>
<td>*49</td>
<td>48.6</td>
<td>48.5</td>
<td></td>
</tr>
<tr>
<td>n3</td>
<td>48.3</td>
<td>48.3</td>
<td>49.1</td>
<td>48.6</td>
<td>*50</td>
<td></td>
</tr>
<tr>
<td>n4</td>
<td>49.7</td>
<td>48.5</td>
<td>*53</td>
<td>48.5</td>
<td>49.7</td>
<td></td>
</tr>
</tbody>
</table>

---

**Important**

In the above table, (*) is the maximum value in that row. The smaller the latency, the better.

Six processors (n0 to n5) are spawned. The latency between n0 and n1 is 48.0 μs. Similarly, the latency between n1 and n2 is 48.2 μs. The minimum latency occurs between n0 and n1 and the maximum latency occurs between n2 and n5, as noted in the table. Checking the latency is particularly useful when you are not seeing expected speedup on a cluster.

**Parallel → Network → Show Bandwidth...**

In addition to checking for latency, you can check your bandwidth. A table containing information about the amount of data communicated within one second between two nodes is displayed in the console. The table will also summarize the minimum and maximum bandwidth between two nodes.

Consider the following example when checking for bandwidth:

<table>
<thead>
<tr>
<th>ID</th>
<th>n0</th>
<th>n1</th>
<th>n2</th>
<th>n3</th>
<th>n4</th>
<th>n5</th>
</tr>
</thead>
<tbody>
<tr>
<td>n0</td>
<td>111.8</td>
<td>*55</td>
<td>111.8</td>
<td>97.5</td>
<td>101.3</td>
<td></td>
</tr>
<tr>
<td>n1</td>
<td>111.8</td>
<td>98.7</td>
<td>111.7</td>
<td>*51</td>
<td></td>
<td></td>
</tr>
<tr>
<td>n2</td>
<td>54.7</td>
<td>72.9</td>
<td>104.8</td>
<td>*45</td>
<td></td>
<td></td>
</tr>
<tr>
<td>n3</td>
<td>111.8</td>
<td>98.7</td>
<td>72.9</td>
<td>64.0</td>
<td>*45</td>
<td></td>
</tr>
<tr>
<td>n4</td>
<td>97.6</td>
<td>11.7</td>
<td>104.8</td>
<td>*64</td>
<td>76.9</td>
<td></td>
</tr>
<tr>
<td>n5</td>
<td>101.2</td>
<td>50.9</td>
<td>45.5</td>
<td>*45</td>
<td>76.9</td>
<td></td>
</tr>
</tbody>
</table>

---

**Important**

In the above table, (*) is the maximum value in that row. The smaller the bandwidth, the better.
Max: 111.847 \[n0<--n3\]

---

**Important**

In the above table, (*) is the minimum value in that row. The larger the bandwidth, the better.

The bandwidth between n0 and n1 is 111.8 MB/s. Similarly, the bandwidth between n1 and n2 is 69.2 MB/s. The minimum amount of bandwidth occurs between n3 and n5 and the maximum occurs between n0 and n3, as noted in the table. Checking the bandwidth is particularly useful when you cannot see good scalability with relatively large cases.

### 34.9.2. Optimizing the Parallel Solver

#### 34.9.2.1. Increasing the Report Interval

In ANSYS Fluent, you can reduce communication and improve parallel performance by increasing the report interval for residual printing/plotting or other solution monitoring reports. You can modify the value for **Reporting Interval** in the Run Calculation Task Page (p. 2269).

**Run Calculation → Calculate...**

**Important**

Note that you will be unable to interrupt iterations until the end of each report interval.

#### 34.9.2.2. Accelerating View Factor Calculations for General Purpose Computing on Graphics Processing Units (GPGPUs)

View factor computations can be accelerated through the `viewfac_acc` utility that uses a combination of MPI/OpenMP/OpenCL models to speed up view factor computations. Irrespective of the number of MPI processes launched, only one MPI process/machine is used for computing view factors. On each machine, one MPI process spawns several OpenMP threads that actually compute the view factors. Since only one MPI process is required per machine, it is recommended that you start just one MPI process per machine and specify the number of OpenMP threads to use when running the utility outside of ANSYS Fluent. With fewer MPI processes, the system memory usage is reduced as well. When running the utility from inside ANSYS Fluent, the number of `viewfac_acc` processes will be same as the number of ANSYS Fluent processes. If OpenCL-capable GPUs are available, then a portion of the view factor computations are done on GPUs using OpenCL, to further speed up the computation. At present, this capability is limited to the hemicube method with the cluster-to-cluster option on lnamd64 and win64 machines.

When using the utility `viewfac_acc` outside of ANSYS Fluent, you can specify the following command line options:

- `-cpu #` (default = -2) The number of OpenMP threads to launch per machine.
  - `-2`: The number of MPI processes.
  - `-1`: The total number of logical CPU cores.
  - `0`: No CPU used.
- `n`: Up to maximum `n`.

- `-gpu #` (default = 1) The number of GPU devices to use per machine.
  - `-1`: The total number of GPU devices.
  - `0`: No GPU used.
  - `n`: Up to maximum `n`.

- `-gpu_cpu_ratio #` (default = 2.0) The ratio of the work load on 1 GPU vs 1 CPU OpenMP thread. This is based on the time consumed by the GPU and the CPU. At the end of the view factor computations, a recommendation is printed for the GPU/CPU work load ratio to use in future computations.

When using the `viewfac_acc` utility from inside an ANSYS Fluent session, use the `/define/models/radiation/s2s-parameters/compute-clusters-and-vf-accelerated` text interface (TUI) command. You will be prompted for the same options described above.

In order to use the GPU for view factor computations, the OpenCL library should be accessible through the appropriate environment variable (LD_LIBRARY_PATH on Inamd64 or %path% on win64). By default on Inamd64, /usr/lib64 is searched, but if the library is installed in another location, then that location should be specified in the LD_LIBRARY_PATH variable.

View factor computations can also be accelerated through the `raytracing_acc` utility that uses the NVIDIA Optix library for tracing the rays. The utility runs in serial but can be launched from a parallel ANSYS Fluent session. The GPU available on the machine running the host process is used in such a scenario, except in a mixed Windows-Linux simulation where the GPU on node-0 is used. An NVIDIA GPU along with CUDA 4.1 is required for using `raytracing_acc`. At present, this utility is available only on Inamd64 (Red Hat Enterprise Linux 5/6, and SUSE Linux Enterprise Server 11) and win64 (Windows 7) machines for 3D problems. In order to use the utility, the CUDA 4.1 library should be accessible through the appropriate environment variable (LD_LIBRARY_PATH on Inamd64 or %path% on win64).

When using the `raytracing_acc` utility from outside an ANSYS Fluent session, the command line is `utility raytracing_acc <input_cluster_file> [output_s2s_file(optional)]`.

When using the `raytracing_acc` utility from inside an ANSYS Fluent session, use the `/define/models/radiation/s2s-parameters/compute-clusters-and-vf-accelerated` text user interface (TUI) command.
Chapter 35: Task Page Reference Guide

This reference guide provides information about the task pages in Fluent.

35.1. Meshing Task Page
35.2. Solution Setup Task Page
35.3. General Task Page
35.4. Models Task Page
35.5. Materials Task Page
35.6. Phases Task Page
35.7. Cell Zone Conditions Task Page
35.8. Boundary Conditions Task Page
35.9. Mesh Interfaces Task Page
35.10. Dynamic Mesh Task Page
35.11. Reference Values Task Page
35.12. Solution Task Page
35.13. Solution Methods Task Page
35.14. Solution Controls Task Page
35.15. Monitors Task Page
35.16. Solution Initialization Task Page
35.17. Calculation Activities Task Page
35.18. Run Calculation Task Page
35.19. Results Task Page
35.20. Graphics and Animations Task Page
35.21. Plots Task Page
35.22. Reports Task Page

35.1. Meshing Task Page

The Meshing task page introduces you to the most common meshing tasks involved in solving your CFD simulation using ANSYS Fluent.

Meshing

The task pages under Meshing provide quick access to panels used for the most common meshing tasks. Additional meshing panels can be accessed through the main menu bar above.

35.2. Solution Setup Task Page

The Solution Setup task page introduces you to the main tasks involved in setting up your CFD simulation using ANSYS Fluent.
35.3. General Task Page

The **General** task page allows you to set various generic problem settings, such as those related to the mesh or the solver.

### General

#### Mesh

- **Scale...**
- **Check**
- **Report Quality**
- **Display...**

#### Solver

- **Type**
  - Pressure-Based
  - Density-Based
- **Velocity Formulation**
  - Absolute
  - Relative
- **Time**
  - Steady
  - Transient
- **Gravity**
- **Units...**

### Controls

**Mesh**
contains controls relating to mesh settings.

**Scale...**
opens the *Scale Mesh Dialog Box* (p. 1890).

**Check**
verifies the validity of the mesh. The check provides volume statistics, mesh topology and periodic boundary information, verification of simplex counters, and verification of node position with reference to the $x$ axis for axisymmetric cases. See *Checking the Mesh* (p. 162) for details.

*It is recommended that you check the mesh right after reading it into the solver, in order to detect any mesh trouble before you get started with the problem setup.*
Report Quality displays various quantities related to the quality of the mesh in the console, such as Minimum Orthogonal Quality and Maximum Aspect Ratio. See Mesh Quality (p. 129) for details.

Display... opens the Mesh Display Dialog Box (p. 1891).

Solver contains controls relating to solver settings.

Type contains the solution methods available for computing a solution for your model. See Using the Solver (p. 1405) for details.

Pressure-Based enables the pressure-based Navier-Stokes solution algorithm (the default).

Density-Based enables the density-based Navier-Stokes coupled solution algorithm.

Velocity Formulation specifies the velocity formulation to be used in the calculation. See Choosing the Relative or Absolute Velocity Formulation (p. 541) for details.

Absolute enables the use of the absolute velocity formulation. This is the default setting.

Relative enables the use of the relative velocity formulation. This option is available only with the Pressure-Based solver.

Time contains options related to time dependence.

Steady specifies that a steady flow is being solved.

Transient enables a time-dependent solution. See Performing Time-Dependent Calculations (p. 1462) for details.

2D Space contains options available only when solving two-dimensional problems.

Planar indicates that the problem is two-dimensional. (This option is available only when you start the 2D version of the solver.)

Axisymmetric indicates that the domain is axisymmetric about the $x$ axis. When Axisymmetric is enabled, the 2D axisymmetric form of the governing equations is solved instead of the 2D Cartesian form. (This option is available only when you start the 2D version of the solver.) Be sure to change the zone type of the axis of rotation to axis, using the Boundary Conditions Task Page (p. 2102), as described in Changing Cell and Boundary Zone Types (p. 203).
**Axisymmetric Swirl**

specifies that the swirl component (circumferential component) of velocity is to be included in your axisymmetric model. You should select this option if you are solving swirling flow in an axisymmetric geometry (see **Swirling and Rotating Flows (p. 519)** for more information).

**Gravity**

enables the specification of gravity.

**Gravitational Acceleration**

sets the $x$, $y$, and $z$ components of the gravitational acceleration vector. (The $z$ component is available only in 3D solvers.) See **Natural Convection and Buoyancy-Driven Flows (p. 765)** for details about buoyancy-driven flows. This option appears only when **Gravity** is enabled.

**Units...**

opens the **Set Units Dialog Box (p. 1894)**.

For additional information, see the following sections:

35.3.1. Scale Mesh Dialog Box
35.3.2. Mesh Display Dialog Box
35.3.3. Set Units Dialog Box
35.3.4. Define Unit Dialog Box
35.3.5. Mesh Colors Dialog Box

### 35.3.1. Scale Mesh Dialog Box

The **Scale Mesh** dialog box allows you to convert the mesh from various units of measurement to SI or to apply custom scale factors to the individual coordinates of the mesh. See **Scaling the Mesh (p. 196)** for details.

![Scale Mesh Dialog Box](image)

**Controls**

**Domain Extents**

displays the Cartesian coordinate extremes of the nodes in the mesh. (These values are not editable; they are purely informational.)
Xmin, Ymin, Zmin  
shows the minimum values of Cartesian coordinates in the mesh.

Xmax, Ymax, Zmax  
shows the maximum values of Cartesian coordinates in the mesh.

Scaling  
contains controls for converting units and setting the scale factors automatically.

Convert Units  
allows you to use the conversion factors provided by ANSYS Fluent. Then indicate the units used when creating the mesh by selecting the appropriate abbreviation for meters, centimeters, millimeters, inches, or feet from the Mesh Was Created In drop-down list. The Scaling Factors will automatically be set to the correct values (for example, 0.0254 meters/inch).

Specify Scaling Factors  
allows you to manually specify a scale factor in each of the Cartesian coordinate directions.

Mesh Was Created In  
contains a list of common units of length. The Scaling Factors will automatically be set based on your selection. The units include common SI and British units such as centimeters (cm), millimeters (mm), inches (in), and feet (ft).

Scaling Factors  
contains the factors applied to the mesh in each of the Cartesian coordinate directions. You can enter values manually, or use the Mesh Was Created In list to set scale factors automatically.

X  
is the scale factor in the x direction.

Y  
is the scale factor in the y direction.

Z  
is the scale factor in the z direction (appears only in 3D).

Scale  
multiplies each of the node coordinates by the specified scale factors.

Unscale  
divides each of the node coordinates by the specified scale factors.

View Length Unit In  
contains a list of common units of length. The Domain Extents will automatically be set based on your selection. The units include common SI and British units such as centimeters (cm), millimeters (mm), inches (in), and feet (ft). The units of length in the Set Units Dialog Box (p. 1894) will change each time you change your selection in the View Length Unit In drop-down list.

35.3.2. Mesh Display Dialog Box

The Mesh Display dialog box controls the display of zone, surface, and partition boundary meshes. See Displaying the Mesh (p. 1606) for details about the items below.
Controls

Options contains the rendering options described below. To see the effects of your selection you must click the Display button.

Nodes enables the display of nodes on the selected surfaces.

Edges enables the display of mesh edges on the selected surfaces.

Faces enables the display of mesh faces (filled meshes) on the selected surfaces.

Partitions enables the display of partition boundaries.

Shrink Factor specifies the amount to shrink faces and cells. See Shrinking Faces and Cells in the Display (p. 1611) for details.

Edge Type controls the display of edges. (These items will not appear if the Edges option is turned off.)

All enables the display of all mesh edges.

Feature enables feature lines in an outline display. See Adding Features to an Outline Display (p. 1610) for details.

Outline enables the display of the mesh outline.
Feature Angle
controls the amount of detail added to a feature outline display. See Adding Features to an Outline Display (p. 1610) for details. (This item will be available only if the Feature edge type is enabled.)

Surface Name Pattern
specifies the pattern to look for in the names of surfaces. Type the pattern in the text field and click Match to select (or deselect) the zones in the Surfaces list with names that match the specified pattern. See Generating Mesh or Outline Plots (p. 1608) for information about matching additional characters using * and ?.

Surfaces
contains a list from which you can select the surfaces for which the mesh is to be drawn.

New Surface
is a drop-down list button that contains a list of surface options:

Point
opens the Point Surface Dialog Box (p. 2239).

Line/Rake
opens the Line/Rake Surface Dialog Box (p. 2240).

Plane
opens the Plane Surface Dialog Box (p. 2241).

Quadric
opens the Quadric Surface Dialog Box (p. 2243).

Iso-Surface
opens the Iso-Surface Dialog Box (p. 2245).

Iso-Clip
opens the Iso-Clip Dialog Box (p. 2246).

Surface Types
contains a selectable list of types of surfaces. If you select (or deselect) an item in this list, all surfaces of that type will be selected (or deselected) automatically in the Surfaces list.

Outline
selects all "outline" boundaries in the Surfaces list. If all outline boundaries are already selected, it deselects them.

Interior
selects all "interior" surfaces in the Surfaces list. If all interior surfaces are already selected, it deselects them.

Adjacency
opens the Adjacency Dialog Box (p. 2411) from which you can identify and display face zones that are adjacent to selected cell zones.

Display
displays the defined mesh plot.

Colors...
opens the Mesh Colors Dialog Box (p. 1895).
35.3.3. Set Units Dialog Box

The **Set Units** dialog box allows you to set the units system for any quantity used in ANSYS Fluent. All quantities may be set to a standard system, such as SI or British, or the units of individual quantities may be set. See [Unit Systems (p. 109)](#) for details about the items below.

![Set Units Dialog Box](image)

### Controls

**Quantities**
- displays the list of all quantities used by ANSYS Fluent for input and output.

**Units**
- lists the units appropriate for the currently selected quantity. Selecting an item in the **Units** list causes that unit to be used for the currently selected quantity.

**Factor**
- displays the conversion factor from the currently selected units to SI.

**Offset**
- displays the conversion offset from the currently selected units to SI.

**Set All to**
- contains standard sets of units that are applied to all quantities when selected.
  - **default**
    - is similar to **si**, but uses degrees instead of radians for angles.
  - **si**
    - selects the System International (SI) standard for all units.
  - **british**
    - selects the English Engineering standard for all units.
  - **cgs**
    - selects the CGS (centimeter-gram-second) standard for all units.
New...  
opens the Define Unit Dialog Box (p. 1895), in which you can specify a customized unit for a particular quantity.

List  
displays the current units for all quantities in the console.

35.3.4. Define Unit Dialog Box

The Define Unit dialog box allows you to customize the units for a particular quantity. It is opened from the Set Units Dialog Box (p. 1894). For details about using this dialog box, see Defining a New Unit (p. 111).

Controls

Quantity  
shows the name of the quantity for which you are defining a new unit. (You cannot edit this field; the quantity is selected in the Set Units Dialog Box (p. 1894).)

Unit  
sets the name for the new unit.

Factor  
sets the conversion factor from the currently selected units to SI.

Offset  
sets the conversion offset from the currently selected units to SI.

35.3.5. Mesh Colors Dialog Box

The Mesh Colors dialog box allows you to control the colors that are used to draw meshes. It is opened from the Mesh Display Dialog Box (p. 1891). See Modifying the Mesh Colors (p. 1609) for details about the items below.
Controls

Options
contains options to select the method by which to set the colors.

Color by Type
sets the color based on the type of zone.

Color by ID
sets the color by ID.

Types
contains a selectable list of zone types. You can select the zone type for which you want to set the color.

Colors
contains a list from which you can select a color for the selected type.

Sample
displays a sample of the currently selected color.

Reset Colors
resets the mesh colors to the default selections.

35.4. Models Task Page

The Models task page allows you to set various generic model settings.
Controls

Models contains a listing of the various models available in ANSYS Fluent.

You can double-click an item in the Models list to open the corresponding dialog box, or you can select the item in the list and click the Edit... button.

Multiphase
- selecting this item and clicking the Edit... button opens the Multiphase Model Dialog Box (p. 1899).

Energy
- selecting this item and clicking the Edit... button opens the Energy Dialog Box (p. 1903).

Viscous
- selecting this item and clicking the Edit... button opens the Viscous Model Dialog Box (p. 1903).

Radiation
- selecting this item and clicking the Edit... button opens the Radiation Model Dialog Box (p. 1917).

Heat Exchanger
- selecting this item and clicking the Edit... button opens the Heat Exchanger Model Dialog Box (p. 1927).

Species
- selecting this item and clicking the Edit... button opens the Species Model Dialog Box (p. 1943).

The following models are made available, depending on your setup of the Species dialog box.

- Spark Ignition - selecting this item and clicking the Edit... button opens the Spark Ignition Dialog Box (p. 1967). Note that spark ignition is only available for transient calculations.
• **Autoignition** - selecting this item and clicking the Edit... button opens the Autoignition Model Dialog Box (p. 1970). Note that autoignition is only available for transient calculations.

• **Inert** - selecting this item and clicking the Edit... button opens the Inert Dialog Box (p. 1972). Note that the inert model is only available when the non-premixed or partially premixed model is selected in the Species Model dialog box, or when a PDF file is read.

• **NOx** - selecting this item and clicking the Edit... button opens the NOx Model Dialog Box (p. 1973). Note that the NOx model is not compatible with premixed combustion.

• **SOx** - selecting this item and clicking the Edit... button opens the SOx Model Dialog Box (p. 1981). Note that the SOx model is not compatible with premixed combustion.

• **Soot** - selecting this item and clicking the Edit... button opens the Soot Model Dialog Box (p. 1985). Note that none of the soot models are compatible with premixed combustion.

• **Decoupled Detailed Chemistry** - selecting this item and clicking the Edit... button opens the Decoupled Detailed Chemistry Dialog Box (p. 1994).

• **Reacting Channel Model** - selecting this item and clicking the Edit... button opens the Reacting Channel Model Dialog Box (p. 1995).

**Discrete Phase**
- selecting this item and clicking the Edit... button opens the Discrete Phase Model Dialog Box (p. 1998).

**Solidification & Melting**
- selecting this item and clicking the Edit... button opens the Solidification and Melting Dialog Box (p. 2007).

**Acoustics**
- selecting this item and clicking the Edit... button opens the Acoustics Model Dialog Box (p. 2009).

**Eulerian Wall Film**
- selecting this item and clicking the Edit... button opens the Eulerian Wall Film Dialog Box (p. 2014).

**Edit...**
displays the dialog box corresponding to the selected item in the Models list.

For additional information, see the following sections:
35.4.1. Multiphase Model Dialog Box
35.4.2. Energy Dialog Box
35.4.3. Viscous Model Dialog Box
35.4.4. Radiation Model Dialog Box
35.4.5. View Factors and Clustering Dialog Box
35.4.6. Participating Boundary Zones Dialog Box
35.4.7. Solar Calculator Dialog Box
35.4.8. Heat Exchanger Model Dialog Box
35.4.9. Dual Cell Heat Exchanger Dialog Box
35.4.10. Set Dual Cell Heat Exchanger Dialog Box
35.4.11. Heat Transfer Data Table Dialog Box
35.4.12. NTU Table Dialog Box
35.4.13. Copy From Dialog Box
35.4.14. Ungrouped Macro Heat Exchanger Dialog Box
35.4.15. Velocity Effectiveness Curve Dialog Box
35.4.1. Multiphase Model Dialog Box

The Multiphase Model dialog box allows you to set parameters for modeling multiphase flow. See Enabling the Multiphase Model (p. 1245) – Including Cavitation Effects (p. 1316) for details.
Controls

Model
allows you to select one of four multiphase models.

Off
  disables the calculation of multiphase flow.

Volume of Fluid
  enables the VOF model described in Volume of Fluid (VOF) Model Theory in the Theory Guide. See Setting Up the VOF Model (p. 1274) for details about using the model. This is available only with the pressure-based solver.

Mixture
  enables the mixture model described in Mixture Model Theory in the Theory Guide. See Setting Up the Mixture Model (p. 1308) for details about using the model. This is available only with the pressure-based solver.

Eulerian
  enables the Eulerian model described in Eulerian Model Theory in the Theory Guide. See Setting Up the Eulerian Model (p. 1317) for details about using the model. This is available only with the pressure-based solver.
Wet Steam
enables the wet steam model described in Wet Steam Model Theory in the Theory Guide. See Setting Up the Wet Steam Model (p. 1356) for details about using the model. This is available only with the density-based solver.

Number of Eulerian Phases
allows you to specify the number of phases for the multiphase calculation. You can specify up to 20 phases.

Coupled Level Set + VOF
allows you to apply an interface tracking method that couples the level set method with the VOF formulation.

Volume Fraction Parameters
contains parameters related to the VOF and Eulerian model. This section of the dialog box will appear only when Volume of Fluid or Eulerian is the selected Model.

Scheme
allows you to select the desired interface-tracking scheme.

Explicit
enables the Euler explicit scheme, described in The Explicit Scheme in the Theory Guide. See Choosing a Volume Fraction Formulation (p. 1247) for more information.

Implicit
enables the implicit scheme, described in The Implicit Scheme in the Theory Guide. See Choosing a Volume Fraction Formulation (p. 1247) for more information.

Volume Fraction Cutoff
specifies a cutoff limit for the volume fraction values. The value that you provide is used as the lower cutoff for the volume fraction. All volume fraction values in the domain below this cutoff value are set to zero. The upper cutoff is calculated as (1.0 - lower cutoff). All volume fraction values above the upper cutoff value are set to 1.0. The default value is 1e-6.

Important
The Volume Fraction Cutoff value can be specified when using the VOF model, or when using the Eulerian Multiphase model with the Explicit scheme.

Courant Number
specifies the maximum Courant number allowed near the free surface. This item will not appear if the Implicit Scheme is selected. See Setting Time-Dependent Parameters for the VOF Model (p. 1305) for details.

Open Channel Flow
enables the model to study the effects of open channel flow. See Open Channel Flow in the Theory Guide and Modeling Open Channel Flows (p. 1275) for details.

Open Channel Wave BC
enables the model to set specific parameters for a particular boundary for open channel wave boundaries. See Backflow Volume Fraction Specification in the Theory Guide and Modeling Open Channel Wave Boundary Conditions (p. 1283) for details.
Zonal Discretization
allows you to set the value of the slope limiter. You can select either diffused or sharp interface behavior in different cell zones. This option is available if the Volume of Fluid model is used, or if the Eulerian model with the Multi-Fluid VOF Model option is enabled.

Mixture Parameters
contains options related to the Mixture model.

Slip Velocity
enables/disables the calculation of slip velocities for the secondary phases as described in Relative (Slip) Velocity and the Drift Velocity in the Theory Guide. See also Solving a Homogeneous Multiphase Flow (p. 1250).

Eulerian Parameters
contains options related to the Eulerian model.

Dense Discrete Phase Model
allows you to include the Dense Discrete Phase model (see Including the Dense Discrete Phase Model (p. 1343) for details). Enabling this model automatically enables the DPM model.

Multi-Fluid VOF Model
allows you to include the multi-fluid VOF model (see Including the Multi-Fluid VOF Model (p. 1355) for details). The multi-fluid VOF model allows the modeling of interface sharpening schemes and free surface flow.

Boiling Model
allows you to include the Boiling model (see Including the Boiling Model (p. 1348) for details).

Boiling Model Options
allows you to select the type of boiling model to apply to your case.

RPI Boiling Model
is where the total heat flux from the wall to the liquid is partitioned into three components, namely the convective heat flux, the quenching heat flux, and the evaporative heat flux. Details about this model can be found in RPI Model in the Theory Guide.

Non-equilibrium Boiling
is a modification to the RPI model in order to model different boiling regimes like DNB and critical heat flux. Details about this model can be found in Non-equilibrium Subcooled Boiling in the Theory Guide.

Critical Heat Flux
is where the critical heat flux condition is characterized by a sharp reduction of local heat transfer coefficients and the excursion of wall surface temperatures. Details about this model can be found in Critical Heat Flux in the Theory Guide.

Number of Discrete Phase
allows you to specify the number of discrete phases when the Dense Discrete Phase Model option is enabled.

Body Force Formulation
contains an additional option for body force calculations.
**Implicit Body Force**

enables the implicit body force treatment described in Including Body Forces (p. 1251).

---

**Note**

If you want ANSYS Fluent to solve the volume fraction equation(s) at every iteration within a time step, use the text command:

```plaintext
define → models → multiphase →
```

and select `vof` as the model. When prompted to solve vof every iteration?, enter yes.

---

### 35.4.2. Energy Dialog Box

The **Energy** dialog box allows you to set parameters related to energy or heat transfer in your model.

![Energy Dialog Box](image)

**Controls**

- **Energy** contains inputs related to the modeling of energy.
  - **Energy Equation** enables/disables the calculation of energy in the model.

---

### 35.4.3. Viscous Model Dialog Box

The **Viscous Model** dialog box allows you to set parameters for inviscid, laminar, and turbulent flow. See Steps in Using a Turbulence Model (p. 709) for details about using this dialog box to set up a turbulent flow calculation.
Controls

Model

contains options for specifying the viscous model.

Inviscid

specifies inviscid flow.

Laminar

specifies laminar flow.

Spalart-Allmaras

specifies turbulent flow to be calculated using the Spalart-Allmaras model. (See Spalart-Allmaras Model in the Theory Guide for background about this model. See Setting Up the Spalart-Allmaras Model (p. 711) for details about using this model.)
**k-epsilon**
specifies turbulent flow to be calculated using one of three $k-\varepsilon$ models. (See Standard, RNG, and Realizable $k-\varepsilon$ Models in the Theory Guide for background about this model. See Setting Up the $k-\varepsilon$ Model (p. 712) for details about using this model.)

**k-omega**
specifies turbulent flow to be calculated using one of two $k-\omega$ models. (See Standard and SST $k-\omega$ Models in the Theory Guide for background about these models. See Setting Up the $k-\omega$ Model (p. 715) for details about using this model.)

**Transition k-kl-omega**
specifies turbulent flow to be calculated using the Transition $k-kl-\omega$ model. (See $k$-kl-ω Transition Model in the Theory Guide for background about this model. See Setting Up the Transition $k$-kl-ω Model (p. 717) for details about using this model.)

**Transition SST**
specifies turbulent flow to be calculated using the Transition SST model. (See Transition SST Model in the Theory Guide for background about this model. See Setting Up the Transition SST Model (p. 717) for details about using this model.)

**Reynolds Stress**
specifies turbulent flow to be calculated using the RSM. (See Reynolds Stress Model (RSM) in the Theory Guide for background about this model. See Setting Up the Reynolds Stress Model (p. 719) for details about using this model.)

**Scale-Adaptive Simulation (SAS)**
specifies turbulent flow to be calculated using the SAS model in combination with the SST $k-\omega$ model. (See Scale-Adaptive Simulation (SAS) Model in the Theory Guide for background about this model. See Setting Up Scale-Adaptive Simulation (SAS) Modeling (p. 722) for details about using this model.)

**Detached Eddy Simulation**
specifies turbulent flow to be calculated using the DES model. (See Detached Eddy Simulation (DES) in the Theory Guide for background about this model. See Setting Up the Detached Eddy Simulation Model (p. 724) for details about using this model.)

**Large Eddy Simulation**
(3D only) specifies turbulent flow to be calculated using the LES model. (See Large Eddy Simulation (LES) Model in the Theory Guide for background about this model. See Setting Up the Large Eddy Simulation Model (p. 729) for details about using this model.)

**Spalart-Allmaras Production**
contains options for the Spalart-Allmaras model. This portion of the dialog box will appear only if Spalart-Allmaras is selected as the **Model**.

**Vorticity-Based**
selects the vorticity-based calculation of the deformation tensor $S$ (see Equation 4.22 in the Theory Guide).

**Strain/Vorticity-Based**
selects the strain/vorticity-based calculation of the deformation tensor $S$ (see Equation 4.24 in the Theory Guide).
**k-epsilon Model**
contains options for specifying which of the $k-\varepsilon$ models is to be used. This portion of the dialog box will appear only if **k-epsilon** is selected as the **Model**.

**Standard**
selects the standard $k-\varepsilon$ model, described in **Standard $k-\varepsilon$ Model** in the Theory Guide and Setting Up the $k-\varepsilon$ Model (p. 712).

**RNG**
selects the RNG $k-\varepsilon$ model, described in **RNG $k-\varepsilon$ Model** in the Theory Guide and Setting Up the $k-\varepsilon$ Model (p. 712).

**Realizable**
selects the realizable $k-\varepsilon$ model, described in **Realizable $k-\varepsilon$ Model** in the Theory Guide and Setting Up the $k-\varepsilon$ Model (p. 712).

**RNG Options**
specifies parameters that affect the solution of problems solved with the RNG $k-\varepsilon$ model. This portion of the dialog box will appear only if **RNG** is selected as the **k-epsilon Model**.

**Differential Viscosity Model**
specifies whether or not the low-Reynolds-number RNG modifications to turbulent viscosity should be included. By default, this option is turned off. It is likely to have an effect only when the near-wall regions in the domain are well resolved in terms of mesh density. See **Differential Viscosity Modification** (p. 737) for details.

**Swirl Dominated Flow**
specifies whether or not the RNG modification to turbulent viscosity for swirling flows should be included. This option is available only in 3D and 2D axisymmetric swirl solvers, and it can yield improved predictions when solving flows with significant swirl. See **Swirl Modification** (p. 737) for details.

**k-omega Model**
contains options for specifying which of the $k-\omega$ models is to be used. This portion of the dialog box will appear only if **k-omega** is selected as the **Model**.

**Standard**
selects the standard $k-\omega$ model, described in **Standard $k-\omega$ Model** in the Theory Guide and Setting Up the $k-\omega$ Model (p. 715).

**SST**
selects the shear-stress transport (SST) $k-\omega$ model, described in **Shear-Stress Transport (SST) $k-\omega$ Model** in the Theory Guide and Setting Up the $k-\omega$ Model (p. 715).

**k-omega Options**
specifies parameters that affect the solution of problems solved with the $k-\omega$ models. This portion of the dialog box will appear only if **k-omega** is selected as the **Model**.

**Low-Re Corrections**
specifies whether corrections that improve the accuracy in predicting low Reynolds number flows should be included. This option is available only for the standard $k-\omega$ model. See **Low-Re Corrections** (p. 737) for details.
Shear Flow Corrections
specifies whether corrections that improve the accuracy in predicting free shear flows should be included. This option is available only for the standard $k-\omega$ model. See Shear Flow Corrections (p. 737) for details.

Turbulence Damping
is required for accurate modeling of the interfacial area. This option is available for the standard and SST $k-\omega$ model. Enter the desired Damping Factor, which by default is set to 10. See Turbulence Damping (p. 737) for details.

Transition SST Options
allows you to include the Roughness Correlation of rough walls as described in Transition SST and Rough Walls in the Theory Guide.

Roughness Correlation
when enabled allows you to specify the Geometric Roughness Height as a constant value.

Reynolds-Stress Model
specifies the various Reynolds stress models (RSM).

Linear Pressure-Strain
enables the linear pressure-strain model. See Linear Pressure-Strain Model in the Theory Guide for details.

Quadratic Pressure-Strain
enables the quadratic pressure-strain model for superior performance in a range of basic shear flows, including plane strain, rotating plane shear, and axisymmetric expansion/contraction. See Quadratic Pressure-Strain Model in the Theory Guide for details. Note that this option cannot be used with the Wall Reflection Effects option or the Enhanced Wall Treatment.

Stress-Omega
enables a stress-transport model that is based on the omega equations and LRR model [116] (p. 2563). This model is ideal for modeling flows over curved surfaces and swirling flows. See Low-Re Stress-Omega Model in the Theory Guide for details.

Reynolds-Stress Options
specifies parameters that affect the solution of problems solved with the Reynolds stress model. This portion of the dialog box will appear only if Reynolds Stress is selected as the Model.

Wall BC from k Equation
enables the explicit setting of boundary conditions for the Reynolds stresses near the walls, using the values computed with Equation 4.225 in the Theory Guide. See Solving the k Equation to Obtain Wall Boundary Conditions (p. 738) for details. This option is on by default.

Wall Reflection Effects
enables the calculation of the component of the pressure strain term responsible for the redistribution of normal stresses near the wall. See Including the Wall Reflection Term (p. 738) for details. Note that this option is not available if you have enabled the Quadratic Pressure-Strain Model.

RANS Model
contains options for the subgrid-scale model used by the Detached Eddy Simulation Model. This portion of the dialog box will appear only if Detached Eddy Simulation Model is selected as the Model.
Spalart-Allmaras
enables the Spalart-Allmaras RANS model. See Detached Eddy Simulation (DES) in the Theory Guide for
details.

Realizable k-epsilon
enables the Realizable $k-\varepsilon$ RANS model. See Detached Eddy Simulation (DES) in the Theory Guide for
details.

SST k-omega
enables the SST $k-\omega$ RANS Model. See Detached Eddy Simulation (DES) in the Theory Guide for
details.

DES Options
contain the option to include a delayed Detached Eddy Simulation.

Delayed DES
is useful for RANS meshes with high aspect ratios in the boundary layer. This option preserves the
RANS model throughout the boundary layer. (See Delayed Detached Eddy Simulation (DDES) (p. 736)
for details.)

Subgrid-Scale Model
contains options for the subgrid-scale model used by the LES model. This portion of the dialog box will
appear only if Large Eddy Simulation is selected as the Model.

Smagorinsky-Lilly
selects the Smagorinsky-Lilly subgrid-scale model described in Subgrid-Scale Models in the Theory
Guide.

WALE
selects the Wall-Adapting local Eddy-Viscosity model described in Wall-Adapting Local Eddy-Viscosity
(WALE) Model in the Theory Guide.

WMLES
selects the algebraic Wall-Modeled LES model described in Algebraic Wall-Modeled LES Model
(WMLES) in the Theory Guide.

WMLES S-Omega
selects the algebraic Wall-Modeled LES $S-\Omega$ model described in Algebraic WMLES S-Omega Model
Formulation in the Theory Guide.

Kinetic-Energy Transport
selects the dynamic kinetic energy subgrid-scale model described in Dynamic Kinetic Energy Subgrid-
Scale Model in the Theory Guide.

LES Model Options
contains options for the Large Eddy Simulation model. This portion of the dialog box will appear only
if Large Eddy Simulation is selected as the Model.

Dynamic Stress
enables the dynamic stress model. It is available when the LES option Smagorinsky-Lilly is enabled.

Dynamic Energy Flux
enables the dynamic energy flux model. It is available when the LES option Kinetic-Energy Transport
is enabled.
**Dynamic Scalar Flux**

enables the dynamic computation of turbulent Sc \( (\sigma_f) \) in Equation 8.5 in the Theory Guide. See Definition of the Mixture Fraction in the Theory Guide for details.

**Dynamic Fvav**

enables the dynamic mixture fraction variance model. It is available when Non-Premixed Combustion or Partially Premixed Combustion is selected in the Species Model Dialog Box (p. 1943). See The Non-Premixed Model for LES in the Theory Guide for details.

**Near-Wall Treatment**

specifies the near-wall treatment to be used for modeling turbulence. See Near-Wall Treatments for Wall-Bounded Turbulent Flows in the Theory Guide for details about the available methods. This portion of the dialog box will appear if k-epsilon or Reynolds Stress is selected as the Model.

**Standard Wall Functions**

enables the use of standard wall functions (described in Standard Wall Functions in the Theory Guide).

**Scalable Wall Functions**

enables the use of scalable wall functions (described in Scalable Wall Functions in the Theory Guide).

**Non-Equilibrium Wall Functions**

enables the use of non-equilibrium wall functions (described in Non-Equilibrium Wall Functions in the Theory Guide).

**Enhanced Wall Treatment**

enables the use of the enhanced wall treatment (described in Enhanced Wall Treatment \( \varepsilon \)-Equation (EWT-\( \varepsilon \)) in the Theory Guide). Note that this option will not appear if you have enabled the Quadratic Pressure-Strain Model under Reynolds-Stress Options.

**User-Defined Wall Functions**

enables you to hook a user-defined function, used to define the Law of the Wall. See User-Defined Wall Functions in the Theory Guide for more information.

**Enhanced Wall Treatment Options**

allows you to include pressure gradient or thermal effects in the calculation. See Near-Wall Treatments for Wall-Bounded Turbulent Flows in the Theory Guide.

**Pressure Gradient Effects**

enables the effect of pressure gradient.

**Thermal Effects**

enables thermal effects in the calculation. This option appears only if the energy equation is enabled.

**Options**

contains general options for viscous modeling.

**Viscous Heating**

(if enabled) includes the viscous dissipation terms in the energy equation. This option is recommended when you are solving a compressible flow. Note that this option is always turned on when one of the density-based solvers is used; you will not be able to turn it off.
Low-Pressure Boundary Slip
includes slip boundary conditions for velocity and temperature for modeling fluid flow at very low pressures as in semiconductor fabrication devices. See Slip Boundary Formulation for Low-Pressure Gas Systems in the Theory Guide. This option is available only for laminar flows.

Full Buoyancy Effects
enables the inclusion of buoyancy effects on $\varepsilon$. See Including Turbulence Generation Due to Buoyancy (p. 734) for details. This option will appear if k-epsilon or Reynolds Stress is selected as the Model and a non-zero gravitational acceleration has been specified in the Operating Conditions Dialog Box (p. 2095).

Curvature Correction
when enabled, modifies the turbulence production term to sensitize the standard eddy-viscosity models to the effects of streamline curvature and system rotation. This is available for the Spalart-Allmaras, k-epsilon, k-omega, Transition SST, Scale-Adaptive Simulation, and Detached Eddy Simulation with the SST k-omega model.

Compressibility Correction
when enabled, can improve the prediction of free shear layers at high Mach numbers. This is available when the compressible form of the ideal gas law or the real-gas model is activated for k-epsilon, k-omega, Transition k-kl-omega, Reynolds Stress, Scale-Adaptive Simulation, and Detached Eddy Simulation with the Realizable k-epsilon model. For details, see Model Enhancements (p. 700).

Mixture Drift Force
includes the effect of turbulent drift velocity when using the Mixture model. See Modeling Turbulence (p. 1336). Note that this option is only available when using the Mixture model with Slip Velocity enabled in the Multiphase Model dialog box. See Including Mixture Drift Force (p. 1316).

Production Kato-Lauder
when enabled, the Kato-Lauder modification for the production term limits the production term in the turbulence equation. For details see, Production Limiters for Two-Equation Models in the Fluent Theory Guide

Production Limiter
when enabled, limits the production term in the turbulence equation. For details see, Production Limiters for Two-Equation Models in the Fluent Theory Guide

Intermittency Transition Model
enables the Intermittency Transition model to account for transitional effects. This option is only available for the SST k-omega, Scale-Adaptive Simulation with SST, and Detached Eddy Simulation with SST models. For details, see Intermittency Transition Model in the Theory Guide.

Intermittency Transition Options
contains an option for the Intermittency Transition model. This group box is only available when the Intermittency Transition Model option is enabled.

Include Crossflow Transition
includes the effects of crossflow instability. For details, see Transport Equations for the Intermittency Transition Model in the Theory Guide.

Turbulence Multiphase Model
contains options for multiphase turbulence models. This portion of the dialog box will appear if Eulerian is selected as the Model in the Multiphase Model Dialog Box (p. 1899).
**Mixture**
specifies the (default) mixture turbulence model.

**Dispersed**
specifies the dispersed turbulence model.

**Per Phase**
specifies the calculation of a set of turbulence equations for each phase.

See **Turbulence Models** in the **Theory Guide** for details about the available multiphase turbulence models.

**Model Constants**

**Cb1**
(only for the Spalart-Allmaras model) is the constant $C_{b1}$ in Equation 4.19 in the **Theory Guide**.

**Cb2**
(only for the Spalart-Allmaras model) is the constant $C_{b2}$ in Equation 4.15 in the **Theory Guide**.

**Cv1**
(only for the Spalart-Allmaras model) is the constant $C_{v1}$ in Equation 4.17 in the **Theory Guide**.

**Cw2**
(only for the Spalart-Allmaras model) is the constant $C_{w2}$ in Equation 4.28 in the **Theory Guide**.

**Cw3**
(only for the Spalart-Allmaras model) is the constant $C_{w3}$ in Equation 4.27 in the **Theory Guide**.

**Cprod**
(only for the Spalart-Allmaras model when the **Strain/Vorticity-Based Production** option is used) is the constant $C_{prod}$ in Equation 4.24 in the **Theory Guide**.

**Cmu**
(only for the standard or RNG $k-ε$ model, the RSM, or the $k-kl-ω$ Transition model) is the constant $C_{μ}$ that is used to compute $μ_τ$.

**C1-Epsilon**
(only for the standard or RNG $k-ε$ model or the RSM) is the constant $C_{1ε}$ used in the transport equation for $ε$.

**C2-Epsilon**
(only for the standard, RNG, or realizable $k-ε$ model or the RSM) is the constant $C_{2ε}$ used in the transport equation for $ε$.

**C3-Epsilon**
(only for the dispersed or per-phase $k-ε$ multiphase models) is the constant $C_{3ε}$ in Equation 17.341 in the **Theory Guide**.
C-lambda
(only for the \( k - k\ell \omega \) Transition model) is the constant \( C_\lambda \) in the definition of the effective length,

CR
(only for the \( k - k\ell \omega \) Transition model) is the constant \( C_R \) used in the definition of \( R \), where \( R \) represents the averaged effect of the breakdown of streamwise fluctuations into turbulence during bypass transition

ANAT
(only for the \( k - k\ell \omega \) Transition model) is the constant \( A_{\text{NAT}} \)

ATS
(only for the \( k - k\ell \omega \) Transition model) is the constant \( A_{\text{TS}} \)

CNAT, crit
(only for the \( k - k\ell \omega \) Transition model) is the constant \( C_{\text{NAT, crit}} \)

CTS, crit
(only for the \( k - k\ell \omega \) Transition model) is the constant \( C_{\text{TS, crit}} \)

CRNAT
(only for the \( k - k\ell \omega \) Transition model) is the constant \( C_{R, \text{NAT}} \)

Anu
(only for the \( k - k\ell \omega \) Transition model) is the constant \( A_v \)

CINT
(only for the \( k - k\ell \omega \) Transition model) is the constant \( C_{\text{INT}} \)

Cw1
(only for the \( k - k\ell \omega \) Transition model) is the constant \( C_{\omega 1} \)

Cw3
(only for the \( k - k\ell \omega \) Transition model) is the constant \( C_{\omega 3} \)

Calpha-teta
(only for the \( k - k\ell \omega \) Transition model) is the constant \( C_{\alpha, \theta} \)

Ctaul
(only for the \( k - k\ell \omega \) Transition model) is the constant \( C_{\tau, 1} \)

SDR Prandtl Number
(only for the \( k - k\ell \omega \) Transition model) is the effective “Prandtl” number for the transport of the specific dissipation rate, \( \sigma_\omega \).

Ca1
(only for the Transition SST model)

Ca2
(only for the Transition SST model)
Ce1
(only for the Transition SST model)

Ce2
(only for the Transition SST model)

C_thetat
(only for the Transition SST model)

C_s1
(only for the Transition SST model)

Intermit. Prandtl #)
(only for the Transition SST model)

Re_theta. Prandtl #)
(only for the Transition SST model)

Swirl Factor
sets the value of $\alpha_\infty$ in Equation 4.40 in the Theory Guide. This item appears for the RNG $k-\varepsilon$ model when the Swirl Dominated Flow option is turned on.

Alpha*_inf
(only for the standard or SST $k-\omega$ model, and the Transition SST model) is the constant $\alpha_\infty^*$ in Equation 4.68 in the Theory Guide.

Alpha_inf
(only for the standard or SST $k-\omega$ model, and the Transition SST model) is the constant $\alpha_\infty$ in Equation 4.76 in the Theory Guide.

Alpha_0
(only for the standard or SST $k-\omega$ model with the Transitional Flows option enabled) is the constant $\alpha_0$ in Equation 4.76 in the Theory Guide.

Beta*_inf
(only for the standard or SST $k-\omega$ model, and the Transition SST model) is the constant $\beta_\infty^*$ in Equation 4.81 in the Theory Guide.

Beta_i
(only for the standard $k-\omega$ model) is the constant $\beta_i$ in Equation 4.89 in the Theory Guide.

R_beta
(only for the standard or SST $k-\omega$ model) is the constant $R_\beta$ in Equation 4.81 in the Theory Guide.

R_k
(only for the standard or SST $k-\omega$ model with the Transitional Flows option enabled) is the constant $R_k$ in Equation 4.68 in the Theory Guide.

R_w
(only for the standard or SST $k-\omega$ model with the Transitional Flows option enabled) is the constant $R_\omega$ in Equation 4.76 in the Theory Guide.
Zeta*  
(only for the standard or SST k-ω model) is the constant $\zeta^*$ in Equation 4.80 in the Theory Guide.

Mt0  
(only for the standard or SST k-ω model) is the constant $M_{t0}$ in Equation 4.90 in the Theory Guide.

a1  
(only for the SST k-ω model, and the Transition SST model) is the constant $a_1$ in Equation 4.98 in the Theory Guide.

Beta_i (Inner)  
(only for the SST k-ω model, and the Transition SST model) is the constant $\beta_{i,1}$ in Model Constants in the Theory Guide.

Beta_i (Outer)  
(only for the SST k-ω model, and the Transition SST model) is the constant $\beta_{i,2}$ in Model Constants in the Theory Guide.

Cs  
(only for LES) is the Smagorinsky constant $C_s$ in Equation 4.260 in the Theory Guide.

C1-PS  
(only for RSM) is the constant $C_1$ in Equation 4.196 in the Theory Guide.

C2-PS  
(only for RSM) is the constant $C_2$ in Equation 4.197 in the Theory Guide.

C1′-PS  
(only for RSM) is the constant $C_1'$ in Equation 4.198 in the Theory Guide.

C2′-PS  
(only for RSM) is the constant $C_2'$ in Equation 4.198 in the Theory Guide.

C1-SSG-PS  
(only for RSM with the Quadratic Pressure-Strain Model) is the constant $C_1$ in Equation 4.207 in the Theory Guide.

C1′-SSG-PS  
(only for RSM with the Quadratic Pressure-Strain Model) is the constant $C_1'$ in Equation 4.207 in the Theory Guide.

C2-SSG-PS  
(only for RSM with the Quadratic Pressure-Strain Model) is the constant $C_2$ in Equation 4.207 in the Theory Guide.

C3-SSG-PS  
(only for RSM with the Quadratic Pressure-Strain Model) is the constant $C_3$ in Equation 4.207 in the Theory Guide.
C3’-SSG-PS
(only for RSM with the Quadratic Pressure-Strain Model) is the constant $C_3^*$ in Equation 4.207 in the Theory Guide.

C4-SSG-PS
(only for RSM with the Quadratic Pressure-Strain Model) is the constant $C_4$ in Equation 4.207 in the Theory Guide.

C5-SSG-PS
(only for RSM with the Quadratic Pressure-Strain Model) is the constant $C_5$ in Equation 4.207 in the Theory Guide.

Prandtl Number
(only for the Spalart-Allmaras model) is the constant $\sigma^*$ in Equation 4.15 in the Theory Guide.

TKE Prandtl Number
(only for the standard or realizable k- $\varepsilon$ model, the standard or SST k- $\omega$ model, the k- k$\varepsilon$- $\omega$ Transition model, or the RSM) is the effective “Prandtl” number for transport of turbulence kinetic energy $\sigma_k$. This effective Prandtl number defines the ratio of the momentum diffusivity to the diffusivity of turbulence kinetic energy via turbulent transport.

TKE (Inner) Prandtl #
(only for the SST k- $\omega$ model, and the Transition SST model) is the effective “Prandtl” number for the transport of turbulence kinetic energy, $\sigma_{k,1}$, inside the near-wall region. See Modeling the Effective Diffusivity in the Theory Guide for details.

TKE (Outer) Prandtl #
(only for the SST k- $\omega$ model, and the Transition SST model) is the effective “Prandtl” number for the transport of turbulence kinetic energy, $\sigma_{k,2}$, outside the near-wall region. See Modeling the Effective Diffusivity in the Theory Guide for details.

TDR Prandtl Number
is the effective “Prandtl” number for transport of the turbulent dissipation rate, $\sigma_{\varepsilon'}$, for the standard or realizable k- $\varepsilon$ model or the RSM. This effective Prandtl number defines the ratio of the momentum diffusivity to the diffusivity of turbulence dissipation via turbulent transport.

For the standard k- $\omega$ model, the TDR Prandtl Number is the effective “Prandtl” number for the transport of the specific dissipation rate, $\sigma_{\omega}$.

SDR (Inner) Prandtl #
(only for the SST k- $\omega$ model, and the Transition SST model) is the effective “Prandtl” number for the transport of the specific dissipation rate, $\sigma_{\omega,1}$, inside the near-wall region. See Modeling the Effective Diffusivity in the Theory Guide for details.

SDR (Outer) Prandtl #
(only for the SST k- $\omega$ model, and the Transition SST model) is the effective “Prandtl” number for the transport of the specific dissipation rate, $\sigma_{\omega,2}$, outside the near-wall region. See Modeling the Effective Diffusivity in the Theory Guide for details.
Dispersion Prandtl Number

(only for the \(k-\varepsilon\) multiphase models) is the effective "Prandtl" number for the dispersed phase, \(\sigma_{pq}\).

Energy Prandtl Number

(for any turbulence model except the RNG \(k-\varepsilon\) model) is the turbulent Prandtl number for energy, \(Pr_t\), in Equation 4.215 in the Theory Guide. (This item will not appear for premixed or partially premixed combustion models.)

Wall Prandtl Number

(for all turbulence models) is the turbulent Prandtl number at the wall, \(Pr_l\) in Equation 4.294 in the Theory Guide. (This item will not appear for adiabatic premixed combustion or partially premixed combustion models.)

Turbulent Schmidt Number

(for turbulent species transport calculations using any turbulence model except the RNG \(k-\varepsilon\) model) is the turbulent Schmidt number, \(Sc_p\), in Equation 7.3 in the Theory Guide.

PDF Schmidt Number

(for non-premixed or partially premixed combustion calculations using any turbulence model) is the model constant \(\sigma_j\) in Equation 8.5 in the Theory Guide.

Production Limiter Clip Factor

This coefficient is used by the Production Limiter. For details, see Equation 4.349 in the Fluent Theory Guide.

User-Defined Transition Correlations

(only for the Transition SST model) allows you to select the user-defined correlations for \(F_{\text{length}}\), \(Re_{\theta_a}\), \(Re_{\theta_t}\).

User-Defined Functions

allows you to select the user-defined functions for various constants.

Turbulent Viscosity

appears for Spalart Allmaras, \(k-\varepsilon\) and \(k-\omega\) models. You can select the user-defined functions for turbulent viscosity in the drop-down list.

Prandtl Numbers

contains a list of relevant Prandtl numbers for which you can select user-defined functions.

TKE Prandtl Number

allows you to select a user-defined function to define the TKE Prandtl number for the standard and realizable \(k-\varepsilon\) models and the standard \(k-\omega\) model.

TDR Prandtl Number

allows you to select a user-defined function to define the TDR Prandtl number for the standard and realizable \(k-\varepsilon\) models.

Energy Prandtl Number

allows you to select a user-defined function to define the Energy Prandtl number for the standard and realizable \(k-\varepsilon\) models and the standard \(k-\omega\) model when energy is enabled.
Wall Prandtl Number
allows you to select a user-defined function to define the Wall Prandtl number for the standard and realizable $k-\varepsilon$ models and the standard $k-\omega$ model when energy is enabled.

SDR Prandtl Number
allows you to select a user-defined function to define the SDR Prandtl number for the standard $k-\omega$ model.

Subgrid-Scale Turbulent Viscosity
allows you to select a user-defined function for the subgrid-scale turbulent viscosity for the LES model.

Scale-Resolving Simulation (SRS) Models
allows you to combine two turbulence models, which are applied on the appropriate regions of the flow domain. For additional information, see Scale-Resolving Simulation (SRS) Models (p. 701).

Scale-Adaptive Simulation (SAS)
allows you to apply SAS in combination with the following $\omega$-based URANS models: the Standard $k-\omega$ model, the Transition SST model, and the $\omega$-based Reynolds stress model (RSM). For additional information, see Setting Up Scale-Adaptive Simulation (SAS) Modeling (p. 722).

Detached Eddy Simulation (DES)
allows you to apply DES in combination with the Transition SST model. For additional information, see Detached Eddy Simulation (DES) (p. 703).

Shielding Functions
allows you to select the shielding functions (SST F1 Function, SST F2 Function, DDES, and IDDES) for the SST Detached Eddy Simulation Model (see Shielding Functions for the SST Detached Eddy Simulation Model (p. 740) for details).

35.4.4. Radiation Model Dialog Box
The Radiation Model dialog box allows you to select a model for radiation heat transfer and set the associated parameters. See Using the Radiation Models (p. 777) – Defining Non-Gray Radiation for the DO Model (p. 795) for details about the items below.
**Controls**

**Model**

Indicates which model, if any, is used to calculate radiation heat transfer. See *Modeling Radiation (p. 777)* for details about modeling radiation heat transfer.

- **Off**
  - Disables the calculation of radiation heat transfer.

- **Rosseland**
  - Enables the Rosseland radiation model.

- **P1**
  - Enables the P-1 radiation model.

- **Discrete Transfer (DTRM)**
  - Enables the discrete transfer radiation model (DTRM).

- **Surface to Surface (S2S)**
  - Enables the surface-to-surface (S2S) radiation model.

- **Discrete Ordinates (DO)**
  - Enables the discrete ordinates (DO) radiation model.
DO/Energy Coupling
allows you to couple the energy and DO intensity equations at each cell, solving them simultaneously. See Defining Non-Gray Radiation for the DO Model (p. 795) for details.

Iteration Parameters
contains parameters related to the DTRM, S2S, and the DO models. This portion of the dialog box will appear only if Discrete Transfer (DTRM), Surface to Surface (S2S), or Discrete Ordinates (DO) is selected as the Model.

Energy Iterations per Radiation Iteration
controls the frequency with which the radiation terms are updated as the continuous phase solution proceeds. The Energy Iterations per Radiation Iteration parameter is set to 10 by default. This implies that the radiation calculation is performed once every 10 iterations of the solution process. Increasing the number can speed the calculation process, but may slow overall convergence.

Maximum Number of Radiation Iterations
controls the maximum number of iterations of the radiation calculation during each global iteration. The default setting of 5 means that the radiosity will be updated up to 5 times. The actual number of iterations will be less if the residual convergence criterion is exceeded at any point during these iterations.

This item appears only when Discrete Transfer or Surface to Surface is selected as the Model.

Residual Convergence Criteria
determines when the radiation intensity update is converged. It is defined as the maximum normalized change in the surface intensity from one radiation iteration to the next (see Equation 13.8 (p. 811)).

This item appears only when Discrete Transfer or Surface to Surface is selected as the Model.

View Factors and Clustering
contains parameters related to the S2S model. This portion of the dialog box will appear only if Surface to Surface is selected as the Model. See Setting Up the S2S Model (p. 782) for more information about the use of these parameters.

Settings...
opens the View Factors and Clustering Dialog Box (p. 1921), in which you can set parameters related to surface clusters and view factors.

Compute/Write/Read...
allows you to compute the view factors, write the computed view factors to a file, and read the file into ANSYS Fluent. When you click Compute/Write/Read..., the Select File Dialog Box (p. 15) will open so that you can specify a name for the file where ANSYS Fluent should save the view factors after computing them.

Read Existing File...
opens the Select File Dialog Box (p. 15), in which you can specify the file from which ANSYS Fluent should read view factors.

Angular Discretization
contains parameters for angular discretization and pixelation for the DO model. This portion of the dialog box will appear only if Discrete Ordinates is selected as the Model. See Setting Up the DO Model (p. 795) for more information about the use of these parameters.
**Theta Divisions, Phi Divisions**
define the number of control angles used to discretize each octant of the angular space (see Figure 5.3: Angular Coordinate System in the Theory Guide).

**Theta Pixels, Phi Pixels**
are used to control the pixelation that accounts for any control volume overhang (see Figure 5.7: Pixelation of Control Angle in the Theory Guide and the figures and discussion preceding it).

**Non-Gray Model**
contains parameters related to the non-gray P-1 model or non-gray DO model. This portion of the dialog box will appear only if P1 or Discrete Ordinates is selected as the Model. See Setting Up the P-1 Model with Non-Gray Radiation (p. 779) or Defining Non-Gray Radiation for the DO Model (p. 795) for more information about the use of these parameters.

**Number of Bands**
specifies the number of bands for the non-gray radiation.

**Wavelength Intervals (n=1)**
contains inputs that define each wavelength band. (It appears only when the Number of Bands is non-zero.) For each band, you can specify a Name, as well as the Start and End wavelength of the band in μm. Note that the wavelength bands are specified for vacuum (n = 1). ANSYS Fluent will automatically account for the refractive index in setting band limits for media with n different from unity.

**Solar Load**
contains parameters related to solar load model that can be used to calculate radiation effects from the sun's rays that enter a computational domain. It is available only for the 3D version of ANSYS Fluent. See Solar Load Model (p. 816) for more information about the use of these parameters.

**Model**
indicates which model is used to calculate radiation effects.

**Off**
disables the calculation of solar radiances.

**Solar Ray Tracing**
Enables the solar ray tracing algorithm

**DO Irradiation**
enables the DO irradiation option. Select Discrete Ordinates under Model before selecting this option.

**Solar Calculator**
opens the Solar Calculator Dialog Box (p. 1926).

**Sun Direction Vector**
contains the components of sun direction vector.

**X, Y, Z**
are the components of the sun direction vector.

**Use Direction Computed from Solar Calculator**
enables the use of direction vector computed from the solar calculator.
Illumination Parameters
contains illumination options.

**Direct Solar Irradiation**
is the amount of energy per unit area due to direct solar irradiation.

**Diffuse Solar Irradiation**
is the amount of energy per unit area due to diffuse solar irradiation.

**Spectral Fraction**
is the fraction of incident solar radiation in the visible part of the solar radiation spectrum. The spectral fraction is not used for DO irradiation since the DO implementation is intended only for a single band. This parameter is available only for **Solar Ray Tracing**.

Update Parameters
contains update parameters for transient simulations.

**Time Steps per Solar Load Update**
specifies the number of time steps that will direct the ANSYS Fluent solver to update the solar load data for the specified flow-time intervals in the unsteady solution process.

35.4.5. View Factors and Clustering Dialog Box

The **View Factors and Clustering** dialog box allows you to set parameters related to surface clusters and view factors for the surface-to-surface radiation model. See Setting Up the S2S Model (p. 782) for information about using this dialog box.
Controls

Clustering contains the methods and settings for creating surface clusters. See Forming Surface Clusters (p. 784) for information about surface cluster settings.

Options gives you a choice of forming clusters either manually or automatically.

Manual allows you to form clusters manually.

Automatic allows ANSYS Fluent to form the cluster automatically.

Manual (available only when the Manual option is enabled) allows you to set the faces per surface cluster (FPSC) value for walls and inlet and outlet boundaries.

Faces per Surface Cluster for Flow Boundary Zones specifies the number of faces in each surface cluster for inlet and outlet boundaries (that is, exhaust fan, inlet vent, intake fan, outlet vent, mass-flow inlet, pressure far-field, pressure inlet, pressure...
outlet, outflow, and velocity inlet boundaries). This FPSC value can also be applied to all walls that are adjacent to fluid zones by clicking the **Apply to All Walls** button. The default is set to 1. See [Clustering](#) in the **Theory Guide** for details about clustering.

**Apply to All Walls**

applies the value specified in the **Faces per Surface Cluster for Flow Boundary Zones** field to all walls that are adjacent to fluid zones.

**Automatic**

(available only when the **Automatic** option is enabled) allows you to assign different faces per surface cluster (FPSC) values to the walls automatically, based on the distance of the walls from and the FPSC values of the walls that are defined as critical.

**Maximum Faces per Surface Cluster**

specifies the maximum number of faces per surface cluster automatically assigned to non-critical wall zones adjacent to fluid zones. The default is set to 10.

**Compute**

results in ANSYS Fluent automatically calculating and updating the face per surface cluster values in the boundary conditions dialog box for non-critical wall zones adjacent to fluid zones, without computing the clusters.

**View Factors**

contains settings for computing the view factors. See [Setting Up the View Factor Calculation (p. 787)](#) for information about view factor calculation settings.

**Basis**

specifies how surfaces are defined for the calculation of view factors. See [Selecting the Basis for Computing View Factors (p. 787)](#) for more information.

**Face to Face**

specifies that the surfaces used to calculate the view factors are the boundary faces.

**Cluster to Cluster**

specifies that the surfaces used to calculate the view factors are the clusters defined by the settings in the **Clustering** group box. The cluster to cluster basis is only available for 3D cases.

**Surfaces**

specifies the geometric orientation of surface pairs with respect to each other when using the hemicube method.

**Blocking**

specifies that the view factor calculation accounts for surfaces that block the views between the surfaces under consideration.

**Nonblocking**

specifies that the view factor calculation does not account for surfaces that block the views between the surfaces under consideration.

**Method**

specifies the method for computing the view factors. See [Selecting the Method for Computing View Factors (p. 788)](#) for information about choosing a method.
**Hemicube**

specifies the use of the hemicube method for computing the view factors. The hemicube method is available only for 3D and axisymmetric cases, and should not be used if any of the zones are defined as periodic or symmetry boundaries.

**Ray Tracing**

specifies the use of the ray tracing method for computing the view factors. For 2D cases, the number of rays used with this method is two times the value set for Resolution in the Parameters group box; for 3D cases, the number of rays is three times the square of the Resolution value.

The ray tracing method is only available with the face to face basis.

**Parameters**

contains settings related to the hemicube and ray tracing methods for computing the view factors. All of these inputs are available when Hemicube is selected under Method, whereas only Resolution is available when Ray Tracing is selected. See Selecting the Method for Computing View Factors (p. 788) for information about setting the method parameters.

**Resolution**

specifies the resolution of the hemicube. The default value is set to 10. You can increase the value to reduce aliasing effects that can lead to overestimated or underestimated view factors.

**Subdivisions**

specifies the number of subfaces into which each face is divided. The default value is set to 5. This parameter is only available when the hemicube method is used in conjunction with the face to face basis.

**Normalized Separation Distance**

specifies the ratio of the minimum face separation to the effective diameter of the face. The default value is set to 5. This parameter is only available for the hemicube method.

**Zones Participating in View Factor Calculation**

allows you to define which boundary zones participate in the view factor calculation. See Specifying Boundary Zone Participation (p. 789) for more information.

**Select...**

opens the Participating Boundary Zones Dialog Box (p. 1924), where you can define which boundary zones participate in the view factor calculation.

### 35.4.6. Participating Boundary Zones Dialog Box

The Participating Boundary Zones dialog box allows you to define which boundary zones participate in the view factor calculation, to display zones in the graphics window, and set the temperature of zones that do not participate in the view factor calculation. See Specifying Boundary Zone Participation (p. 789) for details. This dialog box opens when you click the Select... button next to the Zones Participating in View Factor Calculation label in the View Factors and Clustering dialog box.
**Controls**

**Maximum Distance from Critical Zone**

allows you to view the maximum distance between critical zones and other zones, and set all boundary zones that are located beyond a certain distance from a critical zone as not participating in the view factor calculation.

**To All Other Zones**

displays the maximum of the distances between the centroids of critical and all other wall, inlet, and exit zones when the **Compute** button is clicked. This field is not editable. This is only available when using the **Automatic** option for clustering.

**Compute**

calculates the distances between the centroids of critical zones and all the other wall, inlet, and exit zones and displays the maximum value in the **To All Other Zones** field and the **To Participating Zones** text-entry box. It requires the definition of the critical zone.

**To Participating Zones**

displays the maximum of the distances between the centroids of critical and all other wall, inlet, and exit zones when the **Compute** button is clicked. Unlike the **To All Other Zones** field, you can edit this text-entry box. You can specify the maximum distance allowed between the centroids of critical zones and all other wall, inlet, or exit zones that participate in the view factor calculation; when you click the **Apply** button, all of the zones will be marked as either participating or not participating, according to the distance criteria you specified. Note that this field is only available when using the **Automatic** option for clustering.
Apply
marks all of the wall, inlet, and exit zones as either participating or not participating in the view factor calculation, depending on whether the distance from their centroid to the centroid of a critical zone is equal to or less than value entered for **To Participating Zones**. The **Participating Boundary Zones** and **Non-Participating Boundary Zones** lists will be updated accordingly.

**Participating Boundary Zones**
shows all the zones that are participating in the view factor calculation. You can select a zone and click the arrow button that points to the right to move the zone to the **Non-Participating Boundary Zones** list.

**Non-Participating Boundary Zones**
shows all the zones that are not participating in the view factor calculation. You can select a zone and click the arrow button that points to the left to move the zone to the **Participating Boundary Zones** list.

**Display Zones**
displays any zones selected in the **Participating Boundary Zones** and **Non-Participating Boundary Zones** lists in the graphics window.

**Non-Participating Boundary Zones Temperature**
allows you to specify the temperature of the zones that do not participate in the view factor calculation.

**35.4.7. Solar Calculator Dialog Box**

The **Solar Calculator** dialog box allows you to set parameters related to the calculation of solar load models. See **Solar Load Model (p. 816)** for details. This dialog box opens when you click the **Solar Calculator...** button in the **Radiation Model** dialog box.

**Controls**

**Global Position**
contains the parameters to define the position of solar radiation.
Longitude
specifies the longitude of the desired location in degrees. Values may range from $-180$ to $180$, where negative values indicate the Western hemisphere and positive values indicate the Eastern hemisphere.

Latitude
specifies the latitude of the desired location in degrees. Values may range from $-90$ (South pole) to $90$ (North pole) with $0$ defined as the equator.

Timezone
specifies the local time zone of the desired location in hours relative to Greenwich Mean Time (+- GMT). This integer value can range from 12 to $-12$.

Starting Date and Time
contains parameters to specify date and time.

Day of Year
contains parameters to specify day and month.

Time of Day
contains parameters to specify hour and minutes.

Mesh Orientation
specifies the orientation as the vectors for North and East in the CFD grid system of coordinates.

Solar Irradiation Method
contains parameters to choose the solar irradiation method.

Theoretical Maximum
enables theoretically maximum solar irradiation method.

Fair Weather Conditions
enables fair weather condition solar irradiation method.

Sunshine Factor
is a linear reduction factor for the computed incident load that allows for cloud cover to be accounted for, if appropriate.

35.4.8. Heat Exchanger Model Dialog Box

The Heat Exchanger Model dialog box allows you to define a heat exchanger as part of your model. See Modeling Heat Exchangers (p. 847) for details about using the items below.
Controls

Options
contains options related to the heat exchanger model. See Choosing a Heat Exchanger Model (p. 848) for details about the differences between the models associated with these options.

Dual Cell Model
allows you to enable or disable the Dual Cell heat exchanger model. When this option is enabled, the corresponding Define... button opens the Dual Cell Heat Exchanger Dialog Box (p. 1928).

Ungrouped Macro Model
allows you to enable or disable the Ungrouped Macro heat exchanger model. When this option is enabled, the corresponding Define... button opens the Ungrouped Macro Heat Exchanger Dialog Box (p. 1934).

Macro Model Group
allows you to enable or disable the Macro heat exchanger group model. When this option is enabled, the corresponding Define... button opens the Macro Heat Exchanger Group Dialog Box (p. 1939).

35.4.9. Dual Cell Heat Exchanger Dialog Box

The Dual Cell Heat Exchanger dialog box allows you to use the NTU method for heat transfer calculations. This model allows the solution of auxiliary flow on a separate mesh (other than the primary fluid mesh). See Using the Dual Cell Heat Exchanger Model (p. 850) for information about using this dialog box.

Controls

Heat Exchanger
contains a list of predefined heat exchangers.

New...
opens the Set Dual Cell Heat Exchanger Dialog Box (p. 1929).
Copy
opens the Copy From Dialog Box (p. 1933), which allows you to copy the currently selected heat exchanger.

Delete
removes the currently selected heat exchanger.

Name Pattern
specifies the pattern to look for in the names of heat exchangers. Type the pattern in the text field and click Match to select (or deselect) the listing in the Heat Exchanger list with names that match the specified pattern.

Modify...
opens the Set Dual Cell Heat Exchanger Dialog Box (p. 1929).

35.4.10. Set Dual Cell Heat Exchanger Dialog Box

The Set Dual Cell Heat Exchanger dialog box allows you to define the heat exchanger parameters. See Using the Dual Cell Heat Exchanger Model (p. 850) for details about using this dialog box.

Controls

Name
allows you to specify a name for the dual cell heat exchanger.

Fluid Zones
allows you to specify the fluid zone parameters for the heat exchanger.

Number of Passes
specifies the number of passes for the heat exchanger.
Primary Fluid Zone
allows you to specify the fluid of the primary fluid zone for the heat exchanger.

Auxiliary Fluid Zone
allows you to specify the fluid for the auxiliary fluid zone, per pass.

Important
The selected zones must be overlapping in physical space.

Heat Rejection
contains parameters specific to the rejection of heat in the heat exchanger.

Options
allows you to specify how the heat rejection in the heat exchanger is computed.

Fixed Heat Rejection
allows you to specify heat rejection parameters.

Fixed Inlet Temperature
allows you use total heat rejection as the desired output.

Heat Rejection Targeted
allows you to specify the heat rejection desired from the heat exchanger (available only when the Fixed Heat Rejection option is enabled).

Inlet Zone for Temperature Updates
allows ANSYS Fluent to change the temperature of the specified inlet zone in order to match the targeted heat rejection (available only when the Fixed Heat Rejection option is enabled).

Temperature Update Under-Relaxation
controls convergence (available only when the Fixed Heat Rejection option is enabled).

Iteration Interval Between Temperature Updates
controls divergence (available only when the Fixed Heat Rejection option is enabled).

Performance Data
contains parameters for specifying the heat exchanger’s performance data.

Options
allows you to choose between using raw performance data or NTU performance data.

Raw Data
allows you to specify raw performance data for the heat exchanger.

NTU Data
allows you to specify NTU performance data for the heat exchanger.

Heat Exchanger Performance Data
contains parameters concerning the heat exchanger’s performance data.

NTU Table
opens the NTU Table Dialog Box (p. 1932) (available only when the NTU Data option is enabled).
Heat Transfer Table
- opens the Heat Transfer Data Table Dialog Box (p. 1931) (available only when the Raw Data option is enabled).

Effectiveness-NTU Relation
- computes the NTU values from the heat transfer data. Choose cross-flow-unmixed, parallel-flow, or counter-flow, all of which are described in NTU Relations (available only when the Raw Data option is enabled).

Reference Inlet Temperature
- allows you to specify the inlet reference temperature for the primary and the auxiliary fluids. (Available only when the Raw Data option is enabled.)

Frontal Area
- allows you to specify the frontal area for the heat exchanger.

Primary Fluid
- allows you to specify a value for the Core Frontal Area for the primary fluid, or to compute the value from a surface zone using the Compute From drop-down list.

Auxiliary Fluid
- allows you to specify a value for the Core Frontal Area for the auxiliary fluid, or to compute the value from a surface zone using the Compute From drop-down list.

Coupling
- specifies parameters when you want to couple the heat exchanger passes.

Temperature
- specifies, by default, the mass-weighted average for the temperature of the outlet of Pass 1 to the inlet of Pass 2. Similarly, the mass-weighted-average temperature of the outlet of Pass 2 will be applied at the inlet zone of Pass 3, and so on. (Available only when multiple passes are specified in the Fluid Zones tab.)

Plot NTU
- plots the performance data curve for the selected heat exchanger. The performance data is supplied through the Performance Data tab.

35.4.11. Heat Transfer Data Table Dialog Box

The Heat Transfer Data Table dialog box contains information on the number of fluid flow rates and heat transfer data for the primary and auxiliary fluids. See Using the Ungrouped Macro Heat Exchanger Model (p. 860) for details about using this dialog box.
The **Heat Transfer Data Table** dialog box contains information on the number of fluid flow rates and NTU data for the primary and auxiliary fluids. See [Using the Ungrouped Macro Heat Exchanger Model](p. 860) for details about using this dialog box.

### Controls

- **Number of Auxiliary Fluid Flow Rates**
  sets the number of auxiliary fluid flow rates.

- **Number of Primary Fluid Flow Rates**
  sets the number of primary fluid flow rates.

- **Auxiliary Fluid Flow Rate**
  sets fluid flow rates for the auxiliary fluid.

- **Primary Fluid Flow Rate**
  sets fluid flow rates for the primary fluid.

- **Heat Transfer**
  sets the heat transfer for the corresponding primary and auxiliary fluid flow rates.

- **Read...**
  allows you to read in a file containing heat transfer data.

- **Write...**
  allows you to write a file containing heat transfer data.

### 35.4.12. NTU Table Dialog Box

The **NTU Table** dialog box contains information on the number of fluid flow rates and NTU data for the primary and auxiliary fluids. See [Using the Ungrouped Macro Heat Exchanger Model](p. 860) for details about using this dialog box.
Controls

**Number of Auxiliary Fluid Flow Rates**
sets the number of auxiliary fluid flow rates.

**Number of Primary Fluid Flow Rates**
sets the number of primary fluid flow rates.

**Auxiliary Fluid Flow Rate**
sets fluid flow rates for the auxiliary fluid.

**Primary Fluid Flow Rate**
sets fluid flow rates for the primary fluid.

**NTU**
sets the NTU values for the corresponding primary and auxiliary fluid flow rates.

**Read...**
allows you to read in a file containing NTU data.

**Write...**
allows you to write a file containing NTU data.

**35.4.13. Copy From Dialog Box**
The **Copy From** dialog box allows you to copy the setup of one heat exchanger to another.
Controls

Existing Heat Exchangers
contains a list of heat exchangers, from which you can copy the settings from one heat exchanger to another.

35.4.14. Ungrouped Macro Heat Exchanger Dialog Box

The Ungrouped Macro Heat Exchanger dialog box allows you to set up the ungrouped macro heat exchanger model. See Using the Ungrouped Macro Heat Exchanger Model (p. 860) for details about using this dialog box.
Controls

Fluid Zone
  specifies the zone that represents the heat exchanger.

Model Data
  contains the parameters related to the heat exchanger model.

Options
  allows you to choose one of the following settings:

  Fixed Heat Rejection
    specifies that ANSYS Fluent should compute the auxiliary fluid inlet temperature for a specified heat rejection.

  Fixed Inlet Temperature
    specifies that ANSYS Fluent should compute the total heat rejection of the core for a given inlet auxiliary temperature.

Heat Transfer Model
  allows you to specify either the ntu-model or the simple-effectiveness-model for heat transfer. See Choosing a Heat Exchanger Model (p. 848) for information on the differences between these models.

Core Porosity Model
  contains a drop-down list of all available core porosity models.

Edit...
  opens the Core Porosity Model Dialog Box (p. 1938).

Heat Exchanger Performance Data
  contains the parameters for heat transfer.

  Heat Transfer Data...
    opens the Heat Transfer Data Table Dialog Box (p. 1931). This item will appear for the NTU model only.

  Auxiliary Fluid Temperature
    specifies the auxiliary fluid temperature. This item will appear only for the NTU model.

  Primary Fluid Temperature
    specifies the gas stream temperature. This item will appear only for the NTU model.

  Velocity Effectiveness Curve...
    opens the Velocity Effectiveness Curve Dialog Box (p. 1937) in which you can define the effectiveness of the heat exchanger core (z in Equation 6.11 in the Theory Guide). This item will appear for simple effectiveness model only.

Geometry
  contains parameters to define the macro grid.

  Width
    sets the width of the heat exchanger core. The Width is measured in the pass-to-pass direction.
**Height**
sets the height of the heat exchanger core. The **Height** is measured in the auxiliary fluid inlet direction.

**Depth**
sets the depth of the heat exchanger core.

**Number of Passes**
specifies the number of passes for the macro grid. (See Figure 14.17: 1x4x3 Macros (p. 867).)

**Number of Rows/Pass, Number of Columns/Pass**
specify the number of macro rows and columns per pass in the macro grid. (See Figure 14.17: 1x4x3 Macros (p. 867).)

**View Passes**
displays the macro grid. (This button becomes available after you click **Apply**.) The path of the auxiliary fluid is color-coded in the display: macro 0 is red and macro \( n - 1 \) is blue.

**Draw Mesh**
toggles between displaying and not displaying the mesh when the macro mesh is displayed (using the **View Passes** button). The **Mesh Display Dialog Box** (p. 1891) opens when **Draw Mesh** is selected.

**Update from Plane Tool**
updates the **Auxiliary Fluid Inlet Direction** and **Pass-to-Pass Direction** from the plane tool orientation. The **Width**, **Height**, and **Depth** will also be updated. See **Using the Plane Tool** (p. 1591) for information about using the plane tool.

**Auxiliary Fluid Inlet Direction (height)**
specifies the direction in which the auxiliary fluid enters the heat exchanger. See Figure 14.17: 1x4x3 Macros (p. 867).

**Pass-to-Pass Direction (width)**
specifies the direction in which the auxiliary fluid moves at the end of each pass through the heat exchanger. See Figure 14.17: 1x4x3 Macros (p. 867).

**Auxiliary Fluid**
contains the option to specify the auxiliary fluid properties.

**Auxiliary Fluid Properties Method**
contains options for specifying auxiliary fluid properties.

**constant-specific-heat**
allows you to specify a constant value for the auxiliary fluid specific heat.

**user-defined-enthalpy**
allows you to specify a user-defined function for the auxiliary fluid enthalpy.

**Auxiliary Fluid Specific Heat**
specifies the value of \( c_{p,\text{auxiliary}} \) in **Equation 6.17** in the **Theory Guide**. This value is specified only if **constant-specific-heat** is selected.

**Auxiliary Fluid Enthalpy UDF**
allows you to specify a UDF for the auxiliary fluid enthalpy (see **Equation 6.17** in the **Theory Guide**). This option is available only when **user-defined-enthalpy** is selected.
**Auxiliary Fluid Flow Rate**
sets the flow rate of the auxiliary fluid \( m \) in Equation 6.16 in the Theory Guide.

**Heat Rejection**
sets the total heat rejection \( q_{\text{total}} \) in Equation 6.15 in the Theory Guide. This value is specified only if **Fixed Heat Rejection** is selected.

**Initial Temperature**
sets an initial guess for the inlet temperature \( T_{in} \) in Equation 6.11 and Equation 6.16 in the Theory Guide. This value is specified only if **Fixed Heat Rejection** is selected.

**Inlet Temperature**
sets the auxiliary fluid initial temperature \( T_{in} \) in Equation 6.11 and Equation 6.16 in the Theory Guide. This value is specified only if **Fixed Inlet Temperature** is selected in the Model Data tab.

**Inlet Pressure**
sets the auxiliary fluid inlet pressure. This value is specified only if **user-defined-enthalpy** is selected.

**Inlet Quality**
specifies the value of \( \chi \) in Equation 6.20 in the Theory Guide. This value is specified only if **user-defined-enthalpy** is selected.

**Pressure Drop**
specifies the value of \( p_{in} \) in Equation 6.21 in the Theory Guide. This value is specified only if **user-defined-enthalpy** is selected.

**Apply**
saves all the settings for the heat exchanger specified in the Fluid Zone list.

**Delete**
deletes the heat exchanger specified in the Fluid Zone list.

### 35.4.15. Velocity Effectiveness Curve Dialog Box

The **Velocity Effectiveness Curve** dialog box allows you to define effectiveness curve. It is opened by clicking **Velocity Effectiveness Curve**... in the Ungrouped Macro Heat Exchanger Dialog Box (p. 1934).
**Number of Points**  
specifies the number of data pairs in the effectiveness profile. The default value of 1 indicates a constant effectiveness.

**Velocity, Effectiveness**  
specify the data pairs for the effectiveness profile. These items are available only if the simple effective model has been selected.

### 35.4.16. Core Porosity Model Dialog Box

The **Core Porosity Model** dialog box allows you to modify or define a heat exchanger core model. This dialog box opens when you click **Edit...** in the **Ungrouped Macro Heat Exchanger Dialog Box** (p. 1934).

#### Controls

**Name**  
specifies the name of a new heat exchanger core model.

**Database**  
contains a drop-down list of all heat exchanger core models that are currently available.

**Gas-Side Pressure Drop**  
contains parameters that define the air-side pressure drop.

- **Minimum Flow to Face Area Ratio**  
  sets the value of $\sigma$ in Equation 6.2 in the Theory Guide.

- **Entrance Loss Coefficient**  
  sets the value of $K_C$ in Equation 6.2 in the Theory Guide.
Exit Loss Coefficient
sets the value of $K_e$ in Equation 6.2 in the Theory Guide.

Gas Side Surface Area
sets the value of $A$ in Equation 6.2 in the Theory Guide.

Minimum Cross Section Flow Area
sets the value of $A_c$ in Equation 6.2 in the Theory Guide.

Core Friction Coefficient
sets the value of $a$ in Equation 6.3 in the Theory Guide.

Core Friction Exponent
sets the value of $b$ in Equation 6.3 in the Theory Guide.

Change/Create
saves the settings in the dialog box and adds the new model to the Database list.

Read...
opens the Select File Dialog Box (p. 15), in which you can select an external file containing a pre-defined heat exchanger core model.

35.4.17. Macro Heat Exchanger Group Dialog Box

The Macro Heat Exchanger Group dialog box allows you to modify or define a heat exchanger core group.
Controls

Name
specifies the name of a new heat exchanger group.

Fluid Zones
contains a list of all the fluid zones.

HX Groups
contains list of the heat exchanger groups.

Model Data
contains all the parameters to be specified for the model.

Primary Fluid Flow Direction
gives you a choice of gas flow direction.
Width, Height, Depth
specifies the width, height and the depth of the gas flow direction.

Connectivity
allows you to define the upstream and downstream connections.

Upstream
specifies the upstream heat exchanger group.

Downstream
specifies the downstream heat exchanger group.

Heat Transfer Model
allows you to select either the simple-effectiveness-model or the ntu-model. See Choosing a Heat Exchanger Model (p. 848) for information on the differences between these models.

Core Porosity Model
specifies whether default values are chosen for the core porosity model.

Edit...
opens the Core Porosity Model Dialog Box (p. 1938) for the definition of a new core porosity model.

Heat Exchanger Performance Data
contains the parameters for heat transfer.

Heat Transfer Data...
opens the Heat Transfer Data Table Dialog Box (p. 1931). This dialog box allows you to define the heat transfer for different primary and auxiliary fluid flow rates. This item will appear for the NTU model only.

Velocity Effectiveness Curve...
opens the Velocity Effectiveness Curve Dialog Box (p. 1937) in which you can define the effectiveness of the heat exchanger core (c in Equation 6.11 in the Theory Guide). This item will appear for simple effectiveness model only.

Auxiliary Fluid Temperature
specifies the auxiliary fluid temperature. This item will appear for the NTU model only.

Primary Fluid Temperature
specifies the gas stream fluid temperature. This item will appear for the NTU model only.

Geometry
contains parameters to define the macro grid.

Width, Height, Depth
specifies the width, height and the depth of the heat exchanger.

Number of Passes
specifies the number of passes.

Number of Rows/Pass
specifies the number of rows per pass.

Number of Columns/Pass
specifies the number of columns per pass.
View Passes
displays the macro grid. (This button becomes available after you click Set.) The path of the auxiliary fluid is color-coded in the display: macro 0 is red and macro $n-1$ is blue.

Draw Mesh
toggles between displaying and not displaying the mesh when the macro mesh is displayed (using the View Passes button). The Mesh Display Dialog Box (p. 1891) opens when Draw Mesh is selected.

Update from Plane Tool
updates the Auxiliary Fluid Inlet Direction and Pass-to-Pass Direction from the plane tool orientation. The Width, Height, and Depth will also be updated. See Using the Plane Tool (p. 1591) for information about using the plane tool.

Auxiliary Fluid Inlet Direction
specifies the direction in which the auxiliary fluid enters the heat exchanger. See Figure 14.17: 1x4x3 Macros (p. 867).

Pass-to-Pass Direction
specifies the direction in which the auxiliary fluid moves at the end of each pass through the heat exchanger. See Figure 14.17: 1x4x3 Macros (p. 867).

Auxiliary Fluid
contains inputs to specify the properties of the auxiliary fluid.

Properties Method
specifies the method to specify the auxiliary fluid properties. You can choose from constant-specific-heat and user-defined-enthalpy.

Specific Heat
sets the specific heat of the auxiliary fluid ($c_p$ in Equation 6.16 you choose constant-specific-heat.

Enthalpy UDF
sets the enthalpy as defined by the UDF selected from the drop-down list.

Auxiliary Fluid Flow Rate
sets the flow rate of the auxiliary fluid ($\dot{m}$ in Equation 6.16 in the Theory Guide).

Initial Temperature
sets an initial guess for the inlet temperature ($T_{in}$ in Equation 6.11 and Equation 6.16 in the Theory Guide). This value is specified only if Fixed Heat Rejection is selected.

Inlet Pressure
sets the auxiliary fluid inlet pressure. This value is specified only if user-defined-enthalpy is selected.

Inlet Quality
specifies the value of $x$ in Equation 6.20 in the Theory Guide.

Pressure Drop
specifies the value of $p_{in}$ in Equation 6.21 in the Theory Guide. This value is specified only if user-defined-enthalpy is selected.

Supplementary Auxiliary Fluid Stream
specifies properties of the supplementary auxiliary stream.
Supplementary Mass Flow Rate
specifies the supplementary fluid flow rate as constant, polynomial or piecewise-linear.

Supplementary Flow Temperature
specifies the supplementary fluid temperature as constant, polynomial or piecewise-linear.

Supplementary Flow Quality
specifies the supplementary fluid quality.

Create
saves all the settings in the dialog box.

Delete
deletes the group that is selected in the HX Groups list.

Replace
changes the parameters of the already existing group that is selected in the HX Groups list.

Set...
opens the Ungrouped Macro Heat Exchanger Dialog Box (p. 1934), in which you can define a new heat exchanger core model or read one from an external file.

35.4.18. Species Model Dialog Box

The Species Model dialog box allows you to set parameters related to the calculation of species transport and combustion. See Enabling Species Transport and Reactions and Choosing the Mixture Material (p. 888), User Inputs for Wall Surface Reactions (p. 918), User Inputs for Particle Surface Reactions (p. 924), Using the Premixed Combustion Model (p. 1004), Using the Partially Premixed Combustion Model (p. 1014), and Steps for Using the Composition PDF Transport Model (p. 1025) for details about the items below.
Controls

Model
indicates which model, if any, is used to calculate species transport/combustion.

Off
disables species calculations.

Species Transport
enables the calculation of multi-species transport (either non-reacting or reacting, depending on the selection for Reactions). See Modeling Species Transport and Finite-Rate Chemistry (p. 885) for details.

Non-Premixed Combustion
enables the calculation of turbulent reacting flow using the non-premixed combustion model. See Modeling Non-Premixed Combustion (p. 941) for details. This option is available only for turbulent flows using the pressure-based solver.

Premixed Combustion
enables the premixed turbulent combustion model. See Modeling Premixed Combustion (p. 1003) for details. This option is available only for turbulent flows using the pressure-based solver.
Partially Premixed Combustion
enables the partially premixed turbulent combustion model. See Modeling Partially Premixed Combustion (p. 1013) for details. This option is available only for turbulent flows using the pressure-based solver.

Composition PDF Transport
enables the composition PDF transport model. See Modeling a Composition PDF Transport Problem (p. 1025) for details. This option is available only for turbulent flows using the pressure-based solver.

Reactions
contains options related to the modeling of reacting flow. (This section of the dialog box appears only when Species Transport or Composition PDF Transport is the specified Model.)

Volumetric
enables the calculation of reacting flow using the finite-rate formulation. See Volumetric Reactions (p. 886) for details.

Wall Surface
enables the calculation of wall surface reactions. See Wall Surface Reactions and Chemical Vapor Deposition (p. 918) for details. This item will appear only if Volumetric is enabled.

Particle Surface
enables the calculation of particle surface reactions. See Particle Surface Reactions (p. 924) for details. This item will appear only if Volumetric is enabled.

Integration Parameters...
is a command button that opens the Integration Parameters Dialog Box (p. 1961). This button appears for the species transport model, when Volumetric is enabled under Reactions and Stiff Chemistry Solver is enabled under Options or when Eddy-Dissipation Concept is enabled under Turbulence-Chemistry Interaction.

Wall Surface Reaction Options
contains additional options for wall surface reactions. This portion of the dialog box appears only if Wall Surface is enabled under Reactions.

Heat of Surface Reactions
(if enabled) includes the heat release due to surface reactions in the energy equation. You must remember to set appropriate formation enthalpies (standard state enthalpies) if you enable this option.

Mass Deposition Source
(if enabled) includes the effect of surface mass transfer in the continuity equation.

Aggressiveness Factor
is a numerical factor that controls the robustness and the convergence speed. This value ranges between 0 and 1, where 0 is the most robust, but results in the slowest convergence. The default value for the Aggressiveness Factor is 0.5.

Options
contains additional options for the Species Transport model and for the Composition PDF Transport. (This section will not appear in the dialog box for the other models.)

Inlet Diffusion
includes the diffusion flux of species at inlet.
**Diffusion Energy Source**  
(if enabled) includes the effect of enthalpy transport due to species diffusion in the energy equation.

**Full Multicomponent Diffusion**  
enables the full multicomponent diffusion model. See Full Multicomponent Diffusion (p. 456) for details.

**Thermal Diffusion**  
enables the thermal diffusion model. See Thermal Diffusion Coefficients (p. 458) for details.

**Relax to Chemical Equilibrium**  
enables the calculation of the characteristic time for the turbulence-chemistry interaction models. See The Relaxation to Chemical Equilibrium Model for details.

**Stiff Chemistry Solver**  
enables the calculations for modeling stiff laminar flames. See Solution of Stiff Laminar Chemistry Systems (p. 912) for details.

**Liquid Micro-Mixing**  
is used to model liquid reactions. When the Liquid Micro-Mixing model is invoked, ANSYS Fluent uses the volume-weighted-mixing-law formula to calculate the density.

**CHEMKIN-CFD From Reaction Design**  
enables the use of reaction rates-of-production from Reaction Design's CHEMKIN module, coupled to ANSYS Fluent's ISAT algorithm.

**Thickened Flame Model**  
enables the modeling of laminar flames. This application is typically used as an LES combustion model for turbulent premixed and partially-premixed flames.

**Include Temperature Fluctuations**  
enables the calculation of the multi-mode energy equation. This option is available when the composition PDF transport model is selected.

**Mixture Properties**  
contains controls and information about the mixture being modeled. This section of the dialog box will not appear if Premixed Combustion is the selected under Model.

**Mixture Material**  
contains a drop-down list of available mixture materials. When you first enable the Species Transport model, you can choose from all of the mixture materials defined in the database, or you can choose a “template” and define your own material. (Click View... to open the Fluent Database Materials Dialog Box (p. 2030) and check the properties of the mixture material selected in the list.) See Enabling Species Transport and Reactions and Choosing the Mixture Material (p. 888) for details.

When you use the Non-Premixed Combustion or Partially Premixed Combustion model, this list will be inactive. The mixture material for a non-premixed or partially premixed combustion calculation will be determined from the content of the PDF file generated in ANSYS Fluent using the PDF Options parameters.

**Number of Volumetric Species**  
displays the number of gas-phase species in the selected Mixture Material. This is an informational display only; you cannot edit this value.
Number of Solid Species
displays the number of solid species defined in the selected Mixture Material. This is an informational display only; you cannot edit this value. (This list will appear only for Species Transport models involving Wall Surface reactions.)

Number of Site Species
displays the number of site species defined in the selected Mixture Material. This is an informational display only; you cannot edit this value. (This list will appear only for Species Transport models involving Wall Surface reactions.)

Turbulence-Chemistry Interaction
indicates which model is to be used for turbulence-chemistry interaction when the Species Transport model with Volumetric reactions is used.

Laminar Finite-Rate
computes only the Arrhenius rate (see Equation 7.8 in the Theory Guide) and neglects turbulence-chemistry interaction.

Finite-Rate/Eddy-Dissipation
(for turbulent flows) computes both the Arrhenius rate and the mixing rate and uses the smaller of the two.

Eddy-Dissipation
(for turbulent flows) computes only the mixing rate (see Equation 7.26 and Equation 7.27 in the Theory Guide).

Eddy-Dissipation Concept
(for turbulent flows) models turbulence-chemistry interaction with detailed chemical mechanisms (see Equation 7.26 and Equation 7.27 in the Theory Guide).

Coal Calculator...
opens the Coal Calculator Dialog Box (p. 1958).

Options
contains parameters related to the Laminar Finite-Rate or the Eddy-Dissipation Concept model. This section of the dialog box will appear when Laminar Finite-Rate or the Eddy-Dissipation Concept is selected for Turbulence-Chemistry Interaction.

Flow Iterations Per Chemistry Update
specifies how often ANSYS Fluent will update the chemistry during the calculation. Increasing the number can reduce the computational expense of the chemistry calculations.

Aggressiveness Factor
is a numerical factor that controls the robustness and the convergence speed. This value ranges between 0 and 1, where 0 is the most robust, but results in the slowest convergence. The default value for the Aggressiveness Factor is 0.5.

Volume Fraction Constant
specifies the value of \( C_{\infty} \) in Equation 7.29 in the Theory Guide.

Time Scale Constant
specifies the value of \( C_{t} \) in Equation 7.30 in the Theory Guide.
**Number of Grid Points in Flame**
by default are 8 grid points.

**PDF Options**
contains options related for the non-premixed combustion model. (This section will appear only if Non-Premixed Combustion or Partially-Premixed Combustion is the selected Model.)

**Inlet Diffusion**
includes the diffusion flux of species at inlet.

**Compressibility Effects**
can be enabled to account for cases where substantial pressure changes occur in time and/or space when modeling a non-adiabatic system. See Specifying the Operating Pressure for the System (p. 949) for details.

**Liquid Micro-Mixing**
is used to model liquid reactions. When the Liquid Micro-Mixing model is invoked, ANSYS Fluent uses the volume-weighted-mixing-law formula to calculate the density.

**Chemistry tab** contains the parameters to define problems using the chemistry model. See Setting Up the Equilibrium Chemistry Model (p. 947) for details.

**State Relation**

**Chemical Equilibrium**
enables the equilibrium chemistry model. See Setting Up the Equilibrium Chemistry Model (p. 947) for details.

**Steady Diffusion Flamelet**

**Unsteady Diffusion Flamelet**
enables the Eulerian unsteady diffusion flamelet model.

**Diesel Unsteady Flamelet**
enables the diesel unsteady laminar flamelet model. See Using the Diesel Unsteady Laminar Flamelet Model (p. 955) for details.

**Flamelet Generated Manifold**
enables the flamelet generated manifold (FGM) model. This is available when the Partially Premixed Combustion model is selected. See Partially Premixed Combustion in the Theory Guide for details.

**Energy Treatment**

**Adiabatic**
enables adiabatic modeling options for the problem.

**Non-Adiabatic**
enables nonadiabatic modeling options for the problem. See Non-Adiabatic Extensions of the Non-Premixed Model in the Theory Guide for details.
Coal Calculator
opens the Coal Calculator Dialog Box (p. 1958).

Stream Options
contains the parameters for the equilibrium chemistry model or the steady diffusion flamelet model.

Secondary Stream
includes the secondary inlet stream in the model.

Empirical Fuel Stream
enables parameters to define fuel stream empirically. This option is available only with the full equilibrium chemistry model.

Empirical Secondary Stream
enables parameters to define secondary stream empirically. This option is available only with the full equilibrium chemistry model.

Model Settings
contains a list of parameter settings.

Operating Pressure
specifies the system operating pressure used to calculate the density using the ideal gas law. See Specifying the Operating Pressure for the System (p. 949) for details.

Fuel Stream Rich Flammability Limit
specifies the rich flammability limit for fuel stream when the equilibrium chemistry option is used. You will not set these if you have used the empirical definition option for fuel composition. See Enabling the Rich Flammability Limit (RFL) Option (p. 951) for details.

Secondary Stream Flammability Limit
specifies the rich flammability limit for secondary stream when the equilibrium chemistry option is used. You will not set these if you have used the empirical definition option for fuel composition. See Enabling the Rich Flammability Limit (RFL) Option (p. 951) for details.

Empirical Fuel Lower Calorific Value
specifies the lower calorific value of fuel stream.

Empirical Fuel Specific Heat
specifies the specific heat value of fuel stream.

Empirical Fuel Molecular Weight
specifies the molecular weight of the fuel stream.

Empirical Secondary Lower Calorific Value
specifies the lower calorific value of secondary stream.

Empirical Secondary Specific Heat
specifies the specific heat value of secondary stream.

Empirical Secondary Molecular Weight
specifies the molecular weight of the secondary stream.

Options
contains options related to the steady flamelet model.
Create Flamelet

enables the Import CHEMKIN Mechanism... button that opens the CHEMKIN Mechanism Import Dialog Box (p. 2385) where you can import the CHEMKIN mechanism and thermodynamic data, to create a flamelet file. This option is available for the steady flamelet model. See Setting Up the Steady and Unsteady Diffusion Flamelet Models (p. 952) for details.

Import Flamelet

enables the Import Flamelet File... button that opens the The Select File Dialog Box (p. 15) where you can select the existing flamelet in ANSYS Fluent. You can also set the file type parameters to import the existing flamelet in ANSYS Fluent. See Setting Up the Steady and Unsteady Diffusion Flamelet Models (p. 952) for details. This option is available for the steady flamelet model.

File Type

contains the toggle buttons for two flamelet file types.

Standard

enables the import of an ASCII format standard flamelet file.

Oppdif

enables the import of a binary format OPPDIF flamelet file.

CFX-RIF

enables the import of an ASCII format CFX-RIF flamelet file.

Mixture Fraction Method

contains the three methods of computing the mixture fraction profile along the laminar flamelet.

Drake

calculates the mixture fraction using carbon and hydrogen elements.

Bilger

calculates the mixture fraction using hydrocarbon formula.

Nitrogen

calculates the mixture fraction in terms of nitrogen species.

Oppdif Flamelet Type

gives you a choice of importing Single or Multiple OPPDIF files.

Flamelet Property File Name

opens the The Select File Dialog Box (p. 15) in which you can save the existing flamelet in ANSYS Fluent to use when running an existing case.

Thermodynamic Database File Name

specifies a path for the thermodynamic database file to be read.

Boundary

tab contains the list of boundary species and related parameters. This is available only for equilibrium chemistry model. See Defining the Stream Compositions (p. 959) for details.

Species

contains the list of the species used in the problem.
Fuel
specifies the fuel species.

Oxid
specifies the oxidizing species.

Second
specifies the secondary species.

Boundary Species
allows you to specify the species you want to add or remove from the model. You can type the species chemical formula in the text box below it.

Add
adds the species in the model.

Remove
removes the species from the model.

List Available Species
prints a list of all species in the thermodynamic database file (thermo.db) in the console window.

Temperature
specifies the temperature of different streams that you have defined.

Fuel
is the temperature of the fuel inlet in the model.

Oxid
is the temperature of the oxidizer inlet in the model.

Second
is the temperature of the secondary stream inlet in the model.

Specify Species in
allows you to define the unit of species concentration.

Mass Fraction
allows you to specify the species in terms of mass fraction.

Mole Fraction
allows you to specify the species in terms of mole fraction.

Control
tab contains the parameters for exclusion and inclusion of equilibrium species. This is available only for equilibrium chemistry model. See Forcing the Exclusion and Inclusion of Equilibrium Species (p. 970) for details.

Species Excluded from Equilibrium
lists the species excluded from equilibrium calculation.

Species
lists the slow-forming species that are zeroed in the initial flamelet profile.
Add allows you to add equilibrium species.

Remove allows you to remove equilibrium species.

**List Available Species**

prints a list of all species in the thermodynamic database file in the console window.

**Flamelet Controls**

allows you to adjust the controls for the flamelet solution. Note that the Create Flamelet option in the Chemistry tab must be selected for the Steady Diffusion Flamelet or Flamelet Generated Manifold models for these controls to be available.

**Initial Fourier Number**

sets the first time step for the solution.

**Fourier Number Multiplier**

increases the time step at subsequent times. Every time step after the first is multiplied by this value.

**Relative Error Tolerance and Absolute Error Tolerance**

specifies the local error controls during numerical integration.

**Flamelet Convergence Tolerance**

specifies the maximum absolute change in species fraction or temperature at any discrete mixture-fraction.

**Maximum Integration Time**

specifies the maximum total elapsed time for flamelet calculation. ANSYS Fluent will stop the flamelet calculation after the total elapsed time has exceeded this value.

**Flamelet**

tab allows you to adjust the controls for the flamelet solution. See Defining the Flamelet Controls (p. 971) for details.

**Flamelet Parameters**

consist of the controls for the flamelet solution.

---

**Note**

The parameters may vary slightly if you selected the Flamelet Generated Manifold model (see Flamelet Generated Manifold (p. 1017) for those specific parameters).

**Number of Grid Points in Flamelet**

specifies the number of mixture fraction grid points distributed between the oxidizer \((f = 0)\) and the fuel \((f = 1)\).

**Maximum Number of Flamelets**

specifies the maximum number of laminar flamelet profiles to be calculated.

**Initial Scalar Dissipation**

is the scalar dissipation of the first flamelet in the library.
**Scalar Dissipation Step**

specifies the interval between scalar dissipation values (in $s^{-1}$) for which multiple flamelets will be calculated.

**Unsteady Flamelet Parameters**

consist of the controls for the unsteady flamelet solution.

**Number of Grid Points in Flamelet**

specifies the number of mixture fraction grid points distributed between the oxidizer ($f = 0$) and the fuel ($f = 1$).

**Mixture Fraction Lower Limit for Initial Probability**

is the limit at which the unsteady flamelet model temporally convects and diffuses a marker probability equation through a steady-state ANSYS Fluent flow-field.

**Maximum Scalar Dissipation**

is where flamelets extinguish at large scalar dissipation (mixing) rates.

**Courant Number**

is the number at which ANSYS Fluent automatically selects the time step for the probability equation based on this convective Courant number.

**Number of Flamelets**

specifies the number of unsteady laminar flamelets that ANSYS Fluent will automatically generate during the simulation.

**Calculate Flamelets**

begins the laminar flamelet calculation.

**Display Flamelets...**

opens the Flamelet 3D Surfaces Dialog Box (p. 1963) from which you can display 2D plots and 3D surfaces showing the variation of species fraction or temperature with the mean mixture fraction or scalar dissipation.

**Initialize Unsteady Flamelet Probability**

initializes the unsteady flamelet and its probability marker equation.

**Display Unsteady Flamelet...**

opens the Flamelet 2D Curves Dialog Box (p. 1965) from which you can display 2D plots of the different variables.

**Table**

contains parameters to create the look-up table. See Calculating the Look-Up Tables (p. 979) for details of the items listed below.

---

**Note**

If you selected the Flamelet Generated Manifold model, the parameters will be different. See Calculating the Look-Up Tables (p. 1018) for those specific parameters.

---

**Table Parameters**

consist of the controls for the lookup table. A different set of parameters for you to input will be displayed if Automated Grid Refinement is enabled or disabled.
**Initial Number of Grid Points**
specifies the number of grid points for the resolution of the mean mixture fraction, mixture fraction variance, and mean enthalpy (for non-adiabatic systems).

**Maximum Number of Grid Points**
specifies the maximum number of grid points used for tabulation. The grid refinement procedure will stop inserting the points when either the change in value and slope between successive points is within tolerance or the maximum number of grid points are generated.

**Maximum Change in Value Ratio**
specifies the maximum allowable change in value of table variables between successive grid points as specified by Equation 8.27 in the Theory Guide.

**Maximum Change in Slope Ratio**
specifies the maximum change in the slope of table variables between successive grid points as specified by Equation 8.28 in the Theory Guide.

**Maximum Number of Species**
is the maximum number of species stored in the lookup tables.

**Minimum Temperature**
specifies the minimum temperature in the lookup tables.

**Number of Mean Mixture Fraction Points**
is the number of discrete values of $\overline{f}$ at which the look-up tables will be computed.

**Number of Secondary Mixture Fraction Points**
is the number of discrete values of $\overline{p}_{sec}$ at which the look-up tables will be computed. This option is available only when a secondary stream has been defined.

**Number of Mixture Fraction Variance Points**
is the number of discrete values of $\overline{f^2}$ at which the look-up tables will be computed. This option is available only when no secondary stream has been defined.

**Maximum Number of Species**
is the maximum number of species that will be included in the lookup tables.

**Number of Mean Enthalpy Points**
is the number of discrete values of enthalpy at which the three-dimensional look-up tables will be computed. This input is required only if you are modeling a non-adiabatic system.

**Minimum Temperature**
is used to determine the lowest temperature for which the look-up tables are generated (see Figure 8.10: Visual Representation of a Look-Up Table for the Scalar as a Function of Mean Mixture Fraction and Mixture Fraction Variance and Normalized Heat Loss/Gain in Non-Adiabatic Single-Mixture-Fraction Systems in the Theory Guide). This option is available only if you are modeling a non-adiabatic system.

**Automated Grid Refinement**
is an adaptive algorithm that inserts grid points in all table dimensions so that changes in the values of tabulated variables (such as mean temperature, density and species mass fractions) between successive grid points, as well as changes in their slopes, are less than a user specified tolerance.
Include Equilibrium Flamelet
specifies that an equilibrium flamelet (that is, \( \chi = 0 \)) will be generated in ANSYS Fluent and appended to the flamelet library before the PDF table is calculated. This option is available only when you are generating more than one laminar flamelet.

Calculate PDF Table
generates the look-up table.

Display PDF Table
opens the PDF Table Dialog Box (p. 2490) where you can display 2D plots and 3D surfaces showing the variation of species mole fraction, density, or temperature with the mean mixture fraction, mixture fraction variance, or enthalpy.

Properties
tab contains parameters needed to modify the piecewise-linear points. See Modifying the Unburnt Mixture Property Polynomials (p. 1020) for the details.

Partially Premixed Mixture Properties
contains the list of properties that you can modify. Edit... opens the Quadratic Mixture Fraction dialog box where you can modify the values of the polynomial coefficients.

For each polynomial function of \( \tilde{f} \) under Partially Premixed Mixture Properties you can click Edit... and specify values for Coefficient 1, Coefficient 2, Coefficient 3, and Coefficient 4 in the appropriate Quadratic of Mixture Fraction dialog box.

Non-Adiabatic Laminar Flame Speed
when enabled includes the non-adiabatic effects on the laminar flame speed by tabulating the laminar speeds in the PDF table. See Laminar Flame Speed in the Theory Guide.

Recalculate Properties
will calculate the partially premixed properties.

Premix
tab contains the options and the parameters for the Turbulent Flame Speed Model, the Variance Settings, and the Turbulence-Chemistry Interaction.

Turbulent Flame Speed Model
contains the Flame Speed Model drop-down list, which allows you to choose between the zimont or the peters model constants for the Zimont premixed combustion model. (This section will appear only if Premixed Combustion or Partially Premixed Combustion is the selected Model and if the C Equation or G Equation premixed model is chosen.)

Turbulent Length Scale Constant
specifies the value of \( C_D \) in Equation 9.11 in the Theory Guide.

Turbulent Flame Speed Constant
specifies the value of \( \Lambda \) in Equation 9.9 in the Theory Guide.

Stretch Factor Coefficient
specifies the value of \( \mu_{str} \) in Equation 9.16 in the Theory Guide.

Turbulent Schmidt Number
specifies the value of \( Sc_f \) in Equation 9.1 in the Theory Guide.
Wall Damping Coefficient
specifies the value of \( \alpha_w \) in Equation 9.19.

Ewald Corrector
is enabled by default and described in Peters Flame Speed Model.

G Equation Settings
allows you to select either the transport equation or algebraic option for the calculation of the flame distance variance. Consult Peters Flame Speed Model in the Theory guide for the variance transport and algebraic equation expressions (Equation 9.6 and Equation 9.7).

Flame Curvature Source
includes the curvature source term in the G-Equation, which is the last term in Equation 9.4.

Turbulence-Chemistry Interaction
is available if you select Flamelet Generated Manifold for the partially premixed combustion model. The three available options (Finite-Rate, Turbulent Flame Speed, and Finite-Rate/Turbulent Flame Speed) are discussed in FGM Turbulent Closure in the Theory Guide.

Variance Settings
is available for the G Equation and C Equation. (This section will appear only if Premixed Combustion or Partially Premixed Combustion is the selected Model.)

Variance Method
contains a drop-down list of the available two options: transport equation and algebraic. Consult Peters Flame Speed Model in the Theory Guide for the variance transport and algebraic equation expressions (Equation 9.6 and Equation 9.7). It is recommended that you use the transport equation option for RANS and the algebraic option for LES.

Premixed Combustion Model Options
contains options for the premixed combustion model. (This section will appear only if Premixed Combustion is the selected Model.)

Adiabatic
enables the adiabatic premixed combustion model, which calculates temperature using Equation 9.65 in the Theory Guide.

Non-Adiabatic
enables the non-adiabatic premixed combustion model, which calculates temperature using Equation 9.66 in the Theory Guide.

Premixed Model
contains options for choosing a premixed model.

C Equation
allows you to choose the C equation as described in C-Equation Model Theory.

Extended Coherent Flamelet Model
allows you to choose the Extended Coherent Flamelet model as described in Extended Coherent Flamelet Model Theory.

G Equation
allows you to choose the G equation as described in G-Equation Model Theory.
Extended Coherent Flamelet Model Constants
contains model constants for the Extended Coherent Flame Model. (This section will appear only if Pre-mixed Combustion or Partially Premixed Combustion is the selected Model and if the Extended Coherent Flame Model flame speed model is chosen.) See Modifying the Constants for the ECFM Flame Speed Closure (p. 1009) for details.

ITNFS Treatment
contains a drop-down list of the available ITNFS treatments: constant-delta, meneveau, blint, poinset, and constant.

ITNFS Flame Thickness
sets the flame thickness (Equation 9.29 in the Theory Guide).

Turbulent Schmidt Number
set the turbulent Schmidt number ($Sc_t$).

Wall Flux Coefficient
set the wall flux coefficient.

PDF Transport Options
contains options for the Composition PDF Transport combustion model. (This section will appear only if Composition PDF Transport is the selected Model.)

Lagrangian
solves the composition PDF transport equation by stochastically tracking Lagrangian particles through the domain.

Eulerian
assumes a shape for the PDF, allowing Eulerian transport equations to be derived.

Mixing tab contains the mixing models.

Mixing Model
contains options to specify the method for modeling molecular diffusion. (This section will appear only if Composition PDF Transport is the selected Model.) See Particle Mixing in the Theory Guide for details.

Modified Curl
enables the modified curl model for molecular diffusion.

IEM
enables the IEM model for molecular diffusion.

EMST
enables the EMST mixing model for molecular diffusion.

Mixing Constant
specifies the value of the mixing constant $C_{ij}$ in Equation 11.6 and Equation 11.8 in the Theory Guide.

Boundary tab allows you to define the fuel and oxidizer compositions. This is only available if you select Eulerian as the PDF Transport Option.

**Species**
consists of the fuel species and the oxidizer.

**Fuel**
is the mole or mass fraction of the fuel stream. The sum of mass or mole fractions of all species in the fuel stream should be 1.

**Oxidizer**
is the mole or mass fraction of the oxidizer stream. The sum of mass or mole fractions of all species in the fuel oxidizer stream should be 1.

**Specify Species in**
specifies the species as a **Mass Fraction** or **Mole Fraction**.

**Control**
tab contains Lagrangian PDF transport parameters.

**PDF Transport Parameters**
allows you to set the **Particles Per Cell**.

**Particles Per Cell**
sets the number of PDF particles per cell. Higher values of this parameter will reduce statistical error, but increase computational time.

**Local Time Stepping**
toggles the calculation of local time steps. If this option is disabled, then you will need to specify the **Time Step** directly (see Equation 11.4 in the Theory Guide). This option is available for steady-state simulations.

**Convection #**
specifies the particle convection number (see $\Delta t_{\text{conv}}$ in Equation 11.4 in the Theory Guide).

**Diffusion #**
specifies the particle diffusion number (see $\Delta t_{\text{diff}}$ in Equation 11.4 in the Theory Guide).

**Mixing #**
specifies the particle mixing number (see $\Delta t_{\text{mix}}$ in Equation 11.4 in the Theory Guide).

### 35.4.19. Coal Calculator Dialog Box

The **Coal Calculator** dialog box automates the calculations described in Additional Coal Modeling Inputs in ANSYS Fluent (p. 966).
Proximate Analysis is the mass fraction of Volatile, Fixed Carbon, Ash, and Moisture in the coal.

Volatile is the fraction of the volatile component.

Fixed Carbon is calculated as one minus the sum of the actual Volatile, Ash, and Moisture fractions.

Ash is the fraction of ash.

Moisture is the moisture fraction in the coal.

Ultimate Analysis (DAF) is the mass fraction of atomic C, H, O, N and optionally S, in the Dry-Ash-Free (DAF) coal.

Mechanism allows you to set the mechanisms.
Secondary Stream
when enabled, allows you to set the two mixture fraction model with the primary stream representing char as C< s >, and an empirical secondary stream representing the volatiles. This is available when using the non-premixed combustion model.

One-step Reaction
is defined in Equation 15.6 (p. 908).

Two-step Reaction
involves oxidation of volatiles to CO in the first reaction and oxidation of CO to CO₂ in the second reaction, as described in Equation 15.7 (p. 909).

Include SO2
when enabled, allows you to input the atomic mass fraction of sulphur, S, which appears under Ultimate Analysis.

Options

Wet Combustion
when enabled will activate the DPM Wet Combustion option by default in all injections created after the OK button is clicked in the Coal Calculator dialog box.

Settings
is where you will specify the values used in the calculation.

Coal Particle Material Name
is the name of the DPM combusting particle material. The default name is coal-particle.

Coal As-Received HCV
is the higher caloric value of the coal.

Volatile Molecular Weight
is the molecular weight of pure volatiles.

CO/CO₂ Split in Reaction 1 Products
can be used to specify the molar fraction of CO to CO₂ in the first reaction of Equation 15.7 (p. 909).
The default value of 1 implies that all carbon is reacted to CO, with no CO₂ produced.

High Temperature Volatile Yield
is where the enhanced devolatization at higher temperatures can cause the volatile yield to exceed the proximate analysis fraction.

Fraction of N in Char (DAF)
is used in calculating the split of atomic nitrogen for the Fuel NOx model.

Coal Dry Density
is used to calculate the Volume Fraction of liquid-water for the Wet Combustion option in the Injections dialog box.

Gas Phase Reaction
lists the reaction based on your entries for the proximate and ultimate analyses.
35.4.20. Integration Parameters Dialog Box

The **Integration Parameters** dialog box allows you to set the parameters for the integration of the chemical source term $S$ in Equation 11.10 in the Theory Guide. See Using ISAT (p. 1040) for details.

![Integration Parameters Dialog Box](image)

**Integration Method**

- **ISAT** enables the ISAT option and expands the dialog box to include inputs for ISAT parameters.
- **Direct Integration** enables the direct integration method to integrate the chemical source term in the calculation.

**ODE Parameters**

- **Absolute Error Tolerance** specifies the absolute error tolerance.
- **Relative Error Tolerance** specifies the relative error tolerance.

**ISAT parameters**

- **ISAT Error Tolerance** controls the numerical error in ISAT liner interpolation. Decrease this value to get accurate minor species and pollutant predictions.
- **Max. Storage** is the maximum RAM used by the ISAT table, and has a default value is 100 MB.
Verbosity
specifies the level of detail at which you can monitor the ISAT performance.

Clear ISAT Table
purges the ISAT table.

Options
contains options to choose the method for chemistry acceleration.

Dynamic Mechanism Reduction
accelerates chemistry by reducing the chemical kinetics mechanism on-the-fly to include only important species and reactions, with a corresponding decrease in accuracy.

Chemistry Agglomeration
when enabled, provides additional run-time improvement, with a corresponding decrease in accuracy.

Dimension Reduction
is a chemistry acceleration method in addition to ISAT storage-retrieval and Cell Agglomeration, providing faster chemistry calculations with a corresponding loss of accuracy.

Agglomeration Parameters
allows you to specify the Error Tolerance. This determines the size of the clusters and by default the value is 0.05.

Dimension Reduction Parameters
contains settings to accelerate the chemistry.

Number of Represented Species
must be greater than 10 and less than the number of species in the full mechanism. The Number of Represented Species must also be less than 50 minus the number of unrepresented elements (the number of chemical elements in the unrepresented species).

Full Mechanism Material Name
is typically the name of the CHEMKIN mechanism that you imported.

Fuel/Oxidizer Species
is where the boundary and initial fuel and oxidizer, as well as product species, are set as represented species.

Create Reduced Dimension Mixture
creates a new mixture material called reduced-dimension-mixture, which contains the represented species as well as proxy 'species' for the unrepresented elements.

35.4.21. Chemkin Mechanism Import Dialog Box

The Chemkin Mechanism Import dialog box allows you to read the chemical kinetic mechanism and thermodynamic data. See Setting Up the Steady and Unsteady Diffusion Flamelet Models (p. 952) for details on the items listed below.
Gas-Phase CHEMKIN
contains parameters to import the gas phase chemkin mechanism.

Gas-Phase CHEMKIN Mechanism File
specifies the path of the Chemkin file to be read.

Gas-Phase Thermodynamic Database File
specifies the location of the thermodynamic database.

Import Surface Chemkin Mechanism
enables parameters to import the surface chemkin mechanism.

Import Transport Property Databases
(optional) allows you to import transport properties.

35.4.22. Flamelet 3D Surfaces Dialog Box

The Flamelet 3D Surfaces dialog box allows you to display 2D plots and 3D surfaces showing the variation of species fraction or temperature with the mean mixture fraction or scalar dissipation. See Postprocessing the Flamelet Data (p. 976) for details.
Flamelet Type indicates the type of flamelets whose surfaces will be displayed.

Plot Variable enables you to choose temperature or species fraction as the variable to be plotted.

Plot Type consists of options for plot type.

3D Surface enables plotting on 3D surfaces.

2D curve on 3D surface enables plotting of a 2D curve on a 3D surface.

Options consists of the following parameters:

Draw Numbers Box enables the display of a wireframe box with the numerical limits in each coordinate direction.

Write To File enables saving the plot data to a file.

Curve Parameters consists of controls related to plot display.

X-Axis Function consists of the function against which the plot variable will be displayed.

Scalar Dissipation enables display of plot variable against the scalar dissipation function.
**Mixture Fraction**
 enables display of plot variable against the mixture fraction.

**Constant Value of Scalar Dissipation**
 consists of the controls to specify the type of discretization (that is, how the flamelet data will be sliced) for the variable that is being held constant.

**Slice by**
 consists of the controls to specify discretization.

  **Index**
  enables you to specify discretization index of the variable that is being held constant.

  **Value**
  enables you to specify the numerical value of the variable that is being held constant.

**Index**
 consists of the controls that are displayed when you enable **Index** under **Slice by**.

  **Index #**
  displays the index number.

  **Min**
  displays the minimum of the range of integer values that you are allowed to choose from.

  **Max**
  displays the maximum of the range of integer values that you are allowed to choose from.

**Value**
 consists of the controls that are displayed when you enable **Value** under **Slice by**.

  **Value**
  enables you to enter the numerical value of the variable that is being held constant.

  **Min**
  displays the minimum of the range of integer values that you are allowed to choose from.

  **Max**
  displays the minimum of the range of integer values that you are allowed to choose from.

### 35.4.23. Flamelet 2D Curves Dialog Box

The **Flamelet 2D Curves** dialog box allows you to display or write 2D curves of the unsteady flamelet. See **Postprocessing the Flamelet Data (p. 976)** for details.
Options
gives you the option to plot or **Write to File** 2D curves.

Plot Variable
consists of a drop-down list of variables that you can plot or write.

Plot
is available by default. When the **Write to File** option is enabled the **Plot** button changes to a **Write...**

### 35.4.24. Unsteady Flamelet Parameters Dialog Box

The **Unsteady Flamelet Parameters** dialog box (opened by clicking **Set Flamelet Parameters** in the **Flamelet** tab of the **Species Model** dialog box) allows you to specify the initiation time of the unsteady flamelets. See **Using the Diesel Unsteady Laminar Flamelet Model (p. 955)** for details.

**Start CA (deg)**
is the time at which each unsteady laminar flamelet will be generated during your simulation. The time is specified in terms of seconds or degrees of crank angle if the dynamic mesh is enabled.

**Burnt Initial Flamelet**
if enabled, sets the initial flamelet condition to a chemical equilibrium burnt state. Otherwise, the initial flamelet condition is set to unburnt state (default).

### 35.4.25. Flamelet Fluid Zones Dialog Box

The **Flamelet Fluid Zones** dialog box allows you to select the fluid zones for computing zone-averaged pressure and scalar dissipation. The dialog box is opened by clicking **Set Flamelet Fluid Zones** in the **Flamelet** tab of the **Species Model** dialog box. See **Using the Diesel Unsteady Laminar Flamelet Model (p. 955)** for details.
Fluid Zones
is a selectable list of the fluid zones over which the average pressure and scalar dissipation are computed.

35.4.26. Spark Ignition Dialog Box

The Spark Ignition dialog box allows you to define multiple sparks (see Spark Model (p. 1051) for details).

Controls

Number of Sparks
is the quantity of sparks you would like to include in your simulation. You can define up to 16 sparks.

On
if enabled, activates those sparks that will be included in the simulation.
Name
is the name of the spark. You can specify a name, or use the default name.

Define...
opens the Set Spark Ignition Dialog Box (p. 1968).

35.4.27. Set Spark Ignition Dialog Box

The Set Spark Ignition dialog box allows you to set the parameters related to the spark ignition model (see Spark Model (p. 1051) for details).

Controls

Name
displays the name of the spark being defined.

Spark Location
contains the parameters needed to define the location and size of the spark.

X, Y, and Z-Center
specifies x, y, and z coordinates of the spark center.

Initial Radius
specifies the initial spark radius.

Spark Parameters
contains the parameters needed to define the spark.

Start Time
is the time of spark ignition initialization in seconds. When the in-cylinder model is turned on, this control is replaced by the Start Crank Angle control.
**Start Crank Angle**

is the time of spark ignition initialization in crank angle degrees. When the in-cylinder model is turned off, this control is replaced by the **Start Time** option.

**Duration**

is the duration of the spark ignition in seconds.

**Energy**

contains the total energy input by the spark. The default energy value is 0. A positive value for energy will cause the temperature of the spark kernel to rise above the combustion process temperature.

**Flame Speed Model**

allows you to select the turbulent flame speed model for controlling the rate at which the flame front moves.

- **Turbulent Curvature**

  includes the effect of flame curvature as specified in *Turbulent Curvature in the Fluent Theory Guide*.

- **Turbulent Length**

  neglects the effects of flame curvature on the flame speed as described in *Turbulent Length in the Fluent Theory Guide*.

- **Herweg-Maly**

  calculates the turbulent flame speed using Herweg-Maly model. See *Herweg-Maly in the Fluent Theory Guide* for details.

- **Laminar**

  specifies the turbulent flame speed as the laminar flame speed. This option can be used to apply user-defined function (UDF) for the turbulent flame speed definition.

**Flame Surface Density**

allows you to specify the flame surface density as a constant value when **Constant Value** is selected under **ECFM Spark Model**. The value of the flame surface density must be set within the spark region.

**User Sigma Source**

allows you to apply a custom source term to the ECFM equation within the volume of the spark ignition kernel. For more detail about this user-defined function, refer to *Hooking an ECFM Spark Source UDF to ANSYS Fluent in the Fluent UDF Manual*. This selection is available when **User Defined Sigma Source** is enabled under **ECFM Spark Model**.

**ECFM Spark Model**

contains model variants used to define the value of the flame surface density. These portions of the dialog box only appear when the **Extended Coherent Flamelet Model** (Setting Up the Extended Coherent Flame Model (p. 1008)) is selected in the **Species Model** dialog box.

- **Turbulent**

  takes into account flame wrinkling as described in *Turbulent Model in the Fluent Theory Guide*.

- **Zimont**

  operates in the same way as the spark model used with the Zimont combustion model. See *Zimont Model in the Fluent Theory Guide*.

**Constant Value**

allows you to specify the **Flame Surface Density**.
**User Sigma Source**
allows you to apply a custom source term to the ECFM equation within the volume of the spark ignition kernel.

### 35.4.28. Autoignition Model Dialog Box

The **Autoignition Model** dialog box allows you to set the parameters related to the **Knock Model** or the **Ignition Delay Model**. See [Modeling Engine Ignition](p. 1051) for details.

![Autoignition Model Dialog Box]

**Model**
contains options to disable or enable models.

- **Off**
disables the model.

- **Knock Model**
enables the knock model. With the **Premixed Combustion** or **Partially Premixed Combustion** models selected, only the **Knock Model** can be turned on.

- **Ignition Delay Model**
enables the ignition delay model.

**Options**
contains two correlation options that exist with each model.

- **Douaud**
  option is used for knock in spark ignition engines. The modeling parameters that are specified in the GUI for this option are the **Pre Exponential**, **Pressure Exponent**, **Activation Temperature**, **Octane Number**, and **Octane Exponent** (*Equation 13.9* in the Theory Guide).

- **Generalized**
enables generalized correlation described by *Equation 13.10* in the Theory Guide. It requires the same parameters as in the ignition delay model.
**Hardenburg**

enables Hardenburg correlation, which is used for heavy-duty diesel engines. This option is activated only for the ignition delay model.

**Model Parameters**

contains parameters related to the selected model. See Using the Autoignition Models (p. 1055) for the details about the parameters in this dialog box.

**Pre-Exponential**

see Equation 13.10 and Equation 13.9 in the Theory Guide.

**Activation Temperature**

see Equation 13.9 in the Theory Guide.

**Pressure Exponent**

see Equation 13.10 and Equation 13.9 in the Theory Guide.

**Octane Number**

see Equation 13.10 and Equation 13.9 in the Theory Guide.

**Octane Number Exponent**

see Equation 13.10 and Equation 13.9 in the Theory Guide.

**Activation Energy**

see Equation 13.10 and Equation 13.12 in the Theory Guide.

**Temperature Exponent**

see Equation 13.10 in the Theory Guide.

**RPM Exponent**

see Equation 13.10 in the Theory Guide.

**Equivalence Ratio Exponent**

see Equation 13.10 in the Theory Guide.

**Options**

contains two correlation options that exist with this model.

**Douaud**

enables Douaud correlation (Equation 13.9 in the Theory Guide) used for knock in SI engines.
Generalized option (Equation 13.10 in the Theory Guide) in the knock model require the same parameters as in the ignition delay model.

### 35.4.29. Inert Dialog Box

The **Inert** dialog box allows you to set the parameters related to the inert model. For details, see Setting Up the Inert Model (p. 989).

![Inert Dialog Box](image)

** controls

**Model**

allows you to enable or disable the inert model.

- **Off**
  
  disables the model.

- **Inert Transport**
  
  enables the inert model.

**Composition Options**

allows you to select a fixed H/C ratio or to specify the composition.

- **Fixed H/C Ratio**
  
  allows you to specify a fixed ratio of hydrogen to carbon in the H/C Ratio field.

- **User Specified**
  
  allows you to specify an arbitrary composition for the inert stream.
Composition allows you to set the H/C ratio or the mass fraction.

When **Fixed H/C Ratio** is selected under **Composition Options**, the following option(s) are available:

**H/C Ratio**
- Specifies the fixed ratio of hydrogen to carbon when the **Fixed H/C Ratio** option is enabled.

When **User Specified** is selected under **Composition Options**, the following option(s) are available:

**Species**
- Lists the inert species name.

**Mass Fraction**
- Displays the mass fraction of the corresponding species.

**Inert Species**
- Allows you to specify the name of the inert species.

**Add**
- Adds the specified inert species to the species list.

**Remove**
- Removes the specified inert species from the species list.

**Normalize Species**
- Makes sure the species mass fractions add up to 1.

**List Available Species**
- Lists all species in the thermodynamic database file (*thermo.db*) in the console window.

### 35.4.30. NOx Model Dialog Box

The **NOx Model** dialog box allows you to set parameters related to the NOx postprocessor. See **Using the NOx Model** (p. 1065) for details about the items below.
Controls

Models
contains tabs for defining the models used to calculate the NOx production.

Formation
contains the parameters to define the NOx model formation.

Pathways
contains toggle buttons for activating the NOx models to be used for the calculation of NO and HCN concentrations.

Thermal NOx
enables calculation of thermal NOx.

Prompt NOx
enables the calculation of prompt NOx.

Fuel NOx
enables the calculation of fuel NOx. When using the non-premixed combustion model, the Fuel NOx option is only available if the DPM model is also enabled.
N2O Intermediate

enables the formation of NOx through an $N_2O$ intermediate. This option will only appear if one of the previously listed NOx models is enabled.

Fuel Streams

allows you to define multiple fuel streams for prompt NOx and fuel NOx formation.

Number of Fuel Streams

sets the number of fuel streams. You are allowed up to three fuel streams.

Fuel Stream ID

specifies the fuel stream you are defining in the PDF Stream drop-down list, the Fuel Species selection list, the Prompt tab, and the Fuel tab.

PDF Stream

specifies the PDF stream species associated with a particular Fuel Stream ID, when calculating fuel NOx formation in conjunction with the non-premixed combustion model. You can select either the primary or secondary fuel streams, as defined in the PDF table.

Fuel Species

is a list containing all of the defined species, which allows you to specify the species that is the fuel associated with a particular Fuel Stream ID. You cannot select more than 5 fuel species for each fuel stream, and the total number of fuel species selected for all the fuel streams combined cannot exceed 10. Note that when the non-premixed combustion model is enabled, your selection in the Fuel Species list only applies to prompt NOx calculations.

Fuel Sources

is a list containing all of the fuel N sources. This list is available when Fuel NOx is enabled and your case contains injections with different DPM materials defined, such as combusting particles and droplets.

User-Defined Functions

contains the NOx Rate drop-down list, which allows you to use a user-defined function (UDF) to contribute to the rate of NOx production. See the separate UDF Manual for details. Note that you may also use a UDF to specify custom values for the maximum limit ($T_{max}$) that is used for the integration of the temperature PDF (when temperature is accounted for in the turbulence interaction modeling).

Reduction

allows you to specify the reduction methods.

Methods

contains the list of reduction methods.

Reburn

enables the calculation of NOx reburning effects.

SNCR

enables the calculation of NOx reduction by the SNCR method.

Turbulence Interaction Mode

contains parameters related to the effect of turbulent fluctuations on the NOx formation. See NOx Formation in Turbulent Flows in the Theory Guide for details.
PDF Mode
is a drop-down list containing options that take into account turbulent fluctuations when you compute the specified NOx formation. See Setting Turbulence Parameters (p. 1078) for details.

none
specifies the use of laminar NOx rate calculations, so that the effects of turbulence are ignored.

temperature
includes fluctuations of temperature.

temperature/species
includes fluctuations of the temperature and the mass fraction of the species selected in the Species drop-down list (which appears when you select this option).

mixture fraction
includes fluctuations of the mixture fraction(s). This is available for non-premixed combustion calculations only.

PDF Type
allows you to specify the shape of the PDF.

beta
models the PDF using Equation 14.108 in the Theory Guide.

gaussian
models the PDF using Equation 14.111 in the Theory Guide.

PDF Points
controls the number of points at which the beta function in Equation 14.105 or Equation 14.106 in the Theory Guide will be integrated. The default value of 10, which indicates that the beta function will be integrated at 10 points on a histogram basis. The default value should yield an accurate solution with a reasonable computation time. Increasing this value may improve accuracy, but will also increase the computation time. This text box is only available when temperature or temperature/species is selected from the PDF Mode drop-down list.

Temperature Variance
allows you to specify the form of the transport equation that is solved to calculate the temperature variance.

algebraic
is an approximate form of the transport equation (see Equation 14.114 in the Theory Guide).

transported
solves Equation 14.113 in the Theory Guide.

Tmax Option
provides various options for determining the maximum limit(s) for the integration of the PDF used to calculate the temperature.

global-tmax
sets the limit as the maximum temperature in the flow field.

local-tmax-factor
yields cell-based maximum temperature limits by multiplying the local cell mean temperature by the value entered in Tmax Factor.
**specified-tmax**
sets the limit for each cell to be the value entered in **Tmax**.

**user-defined**
allows you to hook a user-defined function that specifies custom values for the maximum limit ($T_{\text{max}}$), which is used for the integration of the temperature PDF. This option is only available if you have already compiled a UDF and selected it in the **Formation** tab.

**Species**
is a drop-down list that appears when **temperature/species** is selected from the **PDF Mode** drop-down list. Here you will select the species whose mass fraction fluctuations will be factored into the NOx rate calculations.

**Formation Model Parameters**
contains the tabs used to define the NOx pathways.

**Thermal**
contains parameters for modeling thermal NOx. (The contents of this tab will appear only if **Thermal NOx** is enabled in the **Formation** tab.)

**[O ] Model**
is a drop-down list in which you can select the method to be used for calculation of thermal NOx. To choose the equilibrium method, select **equilibrium**. To choose the partial equilibrium method, select **partial-equilibrium**. To choose the predicted O concentration method, select **instantaneous**. See **Method 1: Equilibrium Approach**, Method 2: Partial Equilibrium Approach, and Method 3: Predicted O Approach in the **Theory Guide** for details.

**[OH ] Model**
is a drop-down list in which you can select the method to be used for calculation of thermal NOx. To exclude OH, select **none**. To choose the partial equilibrium method, select **partial-equilibrium**. To choose the predicted OH concentration method, select **instantaneous**. See **Method 1: Exclusion of OH Approach**, Method 2: Partial Equilibrium Approach, and Method 3: Predicted OH Approach in the **Theory Guide** for details.

**UDF Rate**
provides options for the treatment of the NOx production specified by the UDF selected in the **Formation** tab.

**Replace Fluent Rate**
replaces ANSYS Fluent’s thermal NOx rate calculations with the custom NOx rate produced by your UDF.

**Add to Fluent Rate**
adds the custom NOx rate produced by your UDF to ANSYS Fluent’s thermal NOx rate calculations.

**Prompt**
contains parameters for modeling prompt NOx. (The contents of this tab will appear only if **Prompt NOx** is enabled in the **Formation** tab.) The settings made in this tab will be associated with a particular fuel stream, specified in the **Fuel Stream ID** text box in the **Formation** tab.

**Fuel Carbon Number**
specifies the number of carbon atoms per fuel molecule.
**Equivalence Ratio**

is the ratio of the actual fuel/air ratio to the stoichiometric fuel/air ratio.

**UDF Rate**

provides options for the treatment of the NOx production specified by the UDF selected in the **Formation** tab.

**Replace Fluent Rate**

replaces ANSYS Fluent’s prompt NOx rate calculations with the custom NOx rate produced by your UDF.

**Add to Fluent Rate**

adds the custom NOx rate produced by your UDF to ANSYS Fluent’s prompt NOx rate calculations.

**Fuel**

contains parameters for modeling fuel NOx. (The contents of this tab will appear only if **Fuel NOx** is enabled in the **Formation** tab.) The settings made in this tab will be associated with a particular fuel stream, specified in the **Fuel Stream ID** text box in the **Formation** tab.

**Fuel Type**

specifies the type of fuel NOx to be calculated.

- **Solid**
  
enables the calculation of solid fuel NOx.

- **Liquid**
  
enables the calculation of liquid fuel NOx.

- **Gas**
  
enables the calculation of gas fuel NOx.

**N Intermediate**

allows you to specify any one of the **hcn**, **nh3**, or **hcn/nh3/no** as the intermediate species. See **Fuel NOx Formation** in the **Theory Guide** for details.

**Volatile N Mass Fraction**

specifies the mass fraction of nitrogen in the volatiles. This parameter appears only for **Solid** fuel NOx calculations.

**Fuel N Mass Fraction**

specifies the mass fraction of nitrogen in the fuel. This parameter appears only for **Gas** or **Liquid** fuel NOx calculations.

**Conversion Fraction**

specifies the overall mass fraction of fuel N (for gas and liquid fuels), or volatile N or char N (for solid fuels), that will be converted to intermediate species and/or product NO.

**Partition Fractions**

specifies the mass fraction of the converted fuel N (for gas and liquid fuels), or volatile N or char N (for solid fuels), that will become **hcn** and **nh3**. The fraction that will become NO will be calculated by the remainder. This option will appear only if you have selected **hcn/nh3/no** for the **N Intermediate** or **Char N Conversion** drop-down lists.
Char N Conversion
is a drop-down list in which you can select no, hcn, nh3, or hcn/nh3/no as the species to which the char N is converted (when you are calculating solid fuel NOx). This parameter appears only for Solid fuel NOx calculations. See Setting Solid (Coal) Fuel NOx Parameters (p. 1073) for details.

Char N Mass Fraction
specifies the mass fraction of nitrogen in the char. This parameter appears only for Solid fuel NOx calculations.

BET Surface Area
sets the BET internal pore surface area (see BET Surface Area in the Theory Guide for details) of the particles. This parameter appears only for Solid fuel NOx calculations.

UDF Rate
provides options for the treatment of the NOx production specified by the UDF selected in the Formation tab.

Replace Fluent Rate
replaces ANSYS Fluent’s fuel NOx rate calculations with the custom NOx rate produced by your UDF.

Add to Fluent Rate
adds the custom NOx rate produced by your UDF to ANSYS Fluent’s fuel NOx rate calculations.

N2O Path
contains the method to be used for formation of NO through an N2O intermediate. (The contents of this tab will appear only if N20 Intermediate is enabled in the Formation tab.)

N2O Model
contains the drop-down list of available N2O models.

quasi-steady
enables the quasi-steady-state method of calculation (The transport equation for the species N2O will not be solved).

transported-simple
enables the transported simple method of calculation (The pollutant species N2O is added in the species list and it’s mass fraction will be calculated using the transport equations).

UDF Rate
provides options for the treatment of the NOx production specified by the UDF selected in the Formation tab.

Replace ANSYS Fluent Rate
replaces the NOx rate calculated by ANSYS Fluent using N2O intermediates with the custom NOx rate produced by your UDF.

Add to ANSYS Fluent Rate
adds the custom NOx rate produced by your UDF to the NOx rate calculated by ANSYS Fluent using N2O intermediates.
Reduction Method Parameters
contains tabs that allow you to define the methods of reduction. (These tabs are do not appear unless a reduction method has been enabled in the Reduction tab.)

Reburn
allows you to define the NOx reduction when Reburn is enabled in the Reduction tab.

Reburn Model
contains the drop-down list of reburn methods.

instantaneous[CH ]
activates instantaneous method in the Reburn Model. When you choose this method a warning to include CH, CH₂, and CH₃ will be displayed.

partial-equilibrium
activates partial method in the Reburn Model.

Reburn Fuel Species
contains reburn fuel species drop-down list.

Equivalent Fuel Type
contains equivalent fuel type drop-down list.

SNCR
allows you to define the NOx reduction when SNCR is enabled in the Reduction tab.

Injection Method
contains the parameters for NOx reduction by SNCR method.

gaseous
includes ammonia or urea as a gas-phase pollutant species from the injection locations.

liquid
includes ammonia or urea as a liquid-phase pollutant species from the injection locations.

Reagent Species
allows you to specify the reagent species as either ammonia (nh₃) or urea (co<nh₂>2)

Reagent Fraction in Stream
allows you to specify the mass fraction of the reagent in the reagent stream. The remaining mass fraction is assumed to be water. If you enabled a secondary stream in your PDF calculation, by default the secondary stream will act as the reagent stream. Note that the Reagent Fraction in Stream text box is only available when using the non-premixed combustion model with a liquid-phase reagent injection.

Urea Decomposition
allows you to specify the decomposition model to use when the selected Reagent Species is co<nh₂>2.

rate-limiting
specifies that the source terms be calculated according to the rates given in Table 14.3: Two-Step Urea Breakdown Process.
user-specified allows you to specify the molar conversion fraction for ammonia, assuming that the rest of the urea is converted to HNCO.

**NH3 Conversion**
is the mole fraction of NH$_3$ in the mixture of NH$_3$ and HNCO instantly created from the reagent injection. The **NH3 Conversion** text box only appears when user-specified is selected for Urea Decomposition.

### 35.4.31. SOx Model Dialog Box

The **SOx Model** dialog box allows you to set parameters related to the SOx postprocessor. See **Using the SOx Model** (p. 1083) for details about the items below.

![SOx Model Dialog Box](image)

**Controls**

**Model** contains the control to enable the model.

**SOx Formation** enables the model.
Fuel Streams
allows you to define multiple fuel streams for SOx formation.

**Number of Fuel Streams**
sets the number of fuel streams. You are allowed up to three fuel streams.

**Fuel Stream ID**
specifies the fuel stream you are defining in the **Fuel Species** selection list and the **Formation Model Parameters** group box.

**Fuel Species**
is a list containing all of the defined species. This list is used to specify the species that is the fuel associated with a particular **Fuel Stream ID**, for any combustion model other than non-premixed combustion. You cannot select more than 5 fuel species for each fuel stream, and the total number of fuel species selected for all the fuel streams combined cannot exceed 10, the list of fuel species is available when **Gas** is the selected **Fuel Type**.

**Fuel Sources**
is a list containing all of the fuel sources. This list is available when **Fuel Type** is **Liquid** or **Solid** and your case contains injections with different DPM materials defined, such as combusting particles and droplets.

**PDF Stream ID**
specifies the PDF stream species associated with a particular **Fuel Stream ID**, when calculating SOx formation in conjunction with the non-premixed combustion model.

- **primary** indicates the primary fuel stream species, as defined in the PDF table.
- **secondary** indicates the secondary fuel stream species, as defined in the PDF table.

**Turbulence Interaction Mode**
contains parameters related to the effect of turbulent fluctuations on the SOx formation. See **SOx Formation in Turbulent Flows** in the **Theory Guide** for details.

**PDF Mode**

is a drop-down list containing options that take into account turbulent fluctuations when you compute the specified SO\textsubscript{2} formation. See **Setting Turbulence Parameters** (p. 1078) for details.

- **none** specifies the use of laminar SOx rate calculations, so that the effects of turbulence are ignored.
- **temperature** includes fluctuations of temperature.
- **temperature/species** includes fluctuations of temperature and mass fraction of the species selected in the **Species** drop-down list (which appears when you select this option).
- **mixture fraction** includes fluctuations of the mixture fraction(s). This is available for non-premixed combustion calculations only.
PDF Type
allows you to specify the shape of the PDF.

**beta**
models the PDF using Equation 14.108 in the Theory Guide.

**gaussian**
models the PDF using Equation 14.111 in the Theory Guide.

PDF Points
controls the number of points at which the beta function in Equation 14.105 or Equation 14.106 in the Theory Guide will be integrated. The default value of 10, which indicates that the beta function will be integrated at 10 points on a histogram basis, will yield an accurate solution with reasonable computation time. Increasing this value may improve accuracy, but will also increase the computation time. This text box is only available when temperature or temperature/species is selected from the PDF Mode drop-down list.

Temperature Variance
allows you to specify the form of transport equation that is solved to calculate the temperature variance.

**algebraic**
is an approximate form of the transport equation (see Equation 14.114 in the Theory Guide).

**transported**
solves Equation 14.113 in the Theory Guide.

Tmax Option
provides various options for determining the maximum limit(s) for the integration of the PDF used to calculate the temperature.

**global-tmax**
sets the limit as the maximum temperature in the flow field.

**local-tmax-factor**
yields cell-based maximum temperature limits by multiplying the local cell mean temperature by the value entered in Tmax Factor.

**specified-tmax**
sets the limit for each cell to be the value entered in Tmax.

**user-defined**
allows you to hook a user-defined function that specifies custom values for the maximum limit ($T_{\text{max}}$), which is used for the integration of the temperature PDF. This option is only available if you have already compiled a UDF and selected it in the SOx Rate drop-down list in the User-Defined Functions group box.

Species
is a drop-down list which appears when temperature/species is selected from the PDF Mode drop-down list. Here you will select the species whose mass fraction fluctuations will be factored into the SOx rate calculations.
User-Defined Functions
allows you to use a user-defined function (UDF) to contribute to the rate of SOx production. See the separate UDF Manual for details. Note that you may also use a UDF to specify custom values for the maximum limit ($T_{max}$) that is used for the integration of the temperature PDF (when temperature is accounted for in the turbulence interaction modeling).

SOx Rate
allows you to select a compiled UDF.

UDF Rate
provides options for the treatment of the SOx production specified by the UDF.

Replace Fluent Rate
replaces ANSYS Fluent’s SOx rate calculations with the custom SOx rate produced by your UDF.

Add to Fluent Rate
adds the custom SOx rate produced by your UDF to ANSYS Fluent’s SOx rate calculations.

Fuel Stream Settings
contains the parameters associated with a particular fuel stream of the SOx model, as specified in the Fuel Stream ID text box in the Fuel Streams group box.

Fuel Type
enables selection of the fuel.

Solid
enables the calculation of solid fuel SOx.

Liquid
enables the calculation of liquid fuel SOx.

Gas
enables the calculation of gas fuel SOx.

S Intermediate
drop-down list enables you to select intermediate species ($h_2s$, $so_2$, or $h_2s/so_2$).

Volatile S Mass Fraction
specifies the mass fraction of sulfur in the volatiles. This parameter appears only for Solid fuel streams.

Fuel S Mass Fraction
field sets the value for correct mass fraction of sulfur in the fuel (kg sulfur per kg fuel). This parameter appears only for Liquid and Gas fuel streams.

Conversion Fraction
specifies the overall mass fraction of the fuel S (for liquid or gas fuels), or the volatile S or char S (for solid fuels), that will be converted to the intermediate species and/or product $SO_2$. The S Intermediate Conversion Fraction has a default value of 1.

Partition Fractions
specifies the mass fraction of the fuel S (for liquid or gas fuels), or the volatile S or char S (for solid fuels) that will become $h_2s$. The remainder will become $SO_2$. This parameter only appears when you select $h_2s/so_2$ for the S Intermediate or Char S Conversion drop-down lists.
Char S Conversion
drop-down list selects the char S conversion path as \textit{so2}, \textit{h2s}, or \textit{so2/h2s}. This parameter appears only for Solid fuel streams.

Char S Mass Fraction
specifies the mass fraction of sulfur in the char. This parameter appears only for Solid fuel streams.

Formation Model Parameters
allows you to include SOx products and intermediates.

\textbf{Include SO3 Product}
includes SO3 as a product in all of the fuel streams, as described in \textit{Reaction Mechanisms for Sulfur Oxidation} in the Theory Guide.

\textbf{Include SH and SO Intermediaries}
includes SH and SO as intermediates in all of the fuel streams, as described in \textit{Reaction Mechanisms for Sulfur Oxidation} in the Theory Guide.

\textbf{[O] Model}
drop-down list specifies the method by which O will be calculated in all of the fuel streams, that is, \textit{equilibrium}, \textit{partial-equilibrium}, or \textit{instantaneous} in the \textit{[O] Model}.

\textbf{[OH] Model}
drop-down list specifies the method by which OH will be calculated in all of the fuel streams, that is, \textit{equilibrium}, \textit{partial-equilibrium}, or \textit{instantaneous} in the \textit{[OH] Model}.

---

\textbf{Important}
To use the predicted O and/or OH concentration, select \textit{instantaneous} in the [O] Model or [OH] Model drop-down list.

---

35.4.32. Soot Model Dialog Box

The Soot Model dialog box allows you to set parameters related to the soot model. See Using the Soot Models (p. 1096) for details about the items below.
Controls

Model
specifies which model should be used for computing soot formation.

Off
disables the calculation of soot formation.

One-Step
enables the one-step soot model described in The One-Step Soot Formation Model in the Theory Guide.

Two-Step
enables the two-step soot model described in The Two-Step Soot Formation Model.

Moss-Brookes
enables the Moss-Brookes soot model described in The Moss-Brookes Model in the Theory Guide.

Moss-Brookes-Hall
enables the Moss-Brookes-Hall soot model described in The Moss-Brookes-Hall Model in the Theory Guide. This option is only available when C₂H₂, C₆H₆, C₆H₅, and H₂ are present in the gas phase species list.

Species Definition
contains inputs for specifying the chemical species for your model.
Fuel
is a drop-down list containing all of the defined species. Here you will select the species that is the fuel for the One-Step and Two-Step models, as well as the Moss-Brookes model when a precursor species is not identified in the defined species list.

Oxidant
is a drop-down list containing all of the defined species. Here you will select the species that is the oxidizer for the One-Step and Two-Step models.

Precursor from
allows you to select from a list of species, enter the correlation values of species, or enables you to hook a user-defined function, used to define the user defined precursor species. This selection is available when using the Moss-Brookes and Moss-Brookes-Hall models.

User Defined Precursor
allows you to hook a user-defined function to specify the user defined soot precursor. This selection is available when using the Moss-Brookes and Moss-Brookes-Hall models.

Soot Precursor
is a selection list containing all of the possible precursor species found via a query of the defined species list. By default, ANSYS Fluent only considers c2h2, c6h6, and c2h4 as possible precursor species. For information about including other species in the possible precursor species search, contact your ANSYS Fluent support engineer. From this list you will select the species that are the soot precursor species for the Moss-Brookes and Moss-Brookes-Hall models.

Surface Growth
is a selection list containing all of the possible surface growth species, as explained previously for the Soot Precursor selection list. Here you will select the species that are the surface growth species for the Moss-Brookes and Moss-Brookes-Hall models.

Fuel Carbon Number
is the number of carbon atoms in the species selected in the Fuel drop-down list. This text box appears only for the Moss-Brookes and Moss-Brookes-Hall model, when user-correlation is selected in the Precursor from drop-down list.

Fuel Hydrogen Number
is the number of hydrogen atoms in the species selected in the Fuel drop-down list. This text box appears only for the Moss-Brookes and Moss-Brookes-Hall model, when user-correlation is selected in the Precursor from drop-down list.

Molecular Weight of Precursor
is the molecular weight of the precursor species. This text box appears only for the Moss-Brookes and Moss-Brookes-Hall model, when user-correlation is selected in the Precursor from drop-down list. The default value is the weight of acetylene.

Precursor Correlation
is a drop-down list you can use to define a laminar diffusion profile which relates mixture fraction to precursor mass fraction. This text box appears only for the Moss-Brookes and Moss-Brookes-Hall model, when user-correlation is selected in the Precursor from drop-down list.

piecewise-polynomial
specifies that the precursor mass fraction is a piecewise-polynomial function of mixture fraction. The default values used by ANSYS Fluent correspond to a methane diffusion flame simulation,
in which both the air and fuel initial temperatures are set to 290 K, and acetylene is assumed as the soot precursor. These values can be revised via the Edit... button.

**constant**
specifies that the precursor mass fraction is a constant function of mixture fraction, the value of which is specified in the text box below the Precursor Correlation drop-down list.

**Edit...**
opens the Piecewise-Polynomial Profile Dialog Box (p. 2037) when piecewise-polynomial is selected from the Precursor Correlation drop-down list, thus allowing you to revise the default values.

**Turbulence Interaction Mode**
contains inputs that specify how turbulent fluctuations are accounted for in the soot formation calculations for the Moss-Brookes and Moss-Brookes-Hall models. For further details on these inputs, see Setting Up the Moss-Brookes Model and the Hall Extension (p. 1102).

**PDF Mode**
is a drop-down list that contains the options for addressing turbulent fluctuations in the soot rate calculations. Note that mixture fraction is the most accurate option, and should be used if it is available.

- **none**
specifies the use of laminar soot rate calculations, so that the effects of turbulence are ignored.
- **temperature**
specifies that the soot rate calculations include the effect of temperature fluctuations.
- **temperature/species**
specifies that the soot rate calculations include the effect of fluctuations of temperature, as well as fluctuations of the mass fraction of the species selected in the Species drop-down list (which appears when you select this option).
- **mixture fraction**
is the most accurate option, specifying that the soot rate calculations include the effect of fluctuations of mixture fraction(s). Note that this option is not available if you are using the eddy-dissipation model.

**PDF Type**
allows you to specify the shape of the PDF.

- **beta**
models the PDF using Equation 14.108 in the Theory Guide.

- **gaussian**
models the PDF using Equation 14.111 in the Theory Guide.

**PDF Points**
controls the number of points at which the beta function will be integrated on a histogram basis. Increasing this number may improve accuracy, but will also increase compute time. This text box is only available when temperature or temperature/species is selected from the PDF Mode drop-down list.

**Temperature Variance**
allows you to specify the form of transport equation that is solved to calculate the temperature variance.
algebraic
is an approximate form of the transport equation (see Equation 14.114 in the Theory Guide).

transported
solves Equation 14.113 in the Theory Guide.

Tmax Option
provides various options for determining the maximum limit(s) for the integration of the PDF used to calculate the temperature.

global-tmax
sets the limit as the maximum temperature in the flow field.

local-tmax-factor
yields cell-based maximum temperature limits by multiplying the local cell mean temperature by the value entered in Tmax Factor.

specified-tmax
sets the limit for each cell to be the value entered in Tmax.

user-defined
allows you to hook a user-defined function that specifies custom values for the maximum limit \(T_{max}\), which is used for the integration of the temperature PDF. This option is only available if you have already compiled a UDF.

Species
is a drop-down list which appears when temperature/species is selected from the PDF Mode drop-down list. Here you will select the species whose mass fraction fluctuations will be factored into the soot rate calculations.

Process Parameters
contains parameters that control the combustion process modeling.

Mean Diameter of Soot Particle
is the assumed average diameter of the soot particles in the combustion system, used to compute the soot particle mass \(m_p\) in Equation 14.134 in the Theory Guide for the Two-Step model.

Mean Density of Soot Particle
is the assumed average density of the soot particles in the combustion system. For the Two-Step model, it is used to compute the soot particle mass \(m_p\) in Equation 14.134 in the Theory Guide. For the Moss-Brookes and Moss-Brookes-Hall models, it is \(\rho_{soot}\) in Equation 14.141 and \(\rho\) in Equation 14.144 in the Theory Guide. The default value supplied by ANSYS Fluent is 1800 kg/m\(^3\) (as was used in the work of Brookes and Moss [13] (p. 2557)).

Stoichiometry for Soot Combustion
is the mass stoichiometry \(\nu_{soot}\) in Equation 14.131 in the Theory Guide, which computes the soot combustion rate in the One-Step and Two-Step models. The default value supplied by ANSYS Fluent (2.6667) assumes that the soot is pure carbon and that the oxidizer is O\(_2\).
Stoichiometry for Fuel Combustion

is the mass stoichiometry \( \nu_{\text{fuel}} \) in Equation 14.131 in the Theory Guide, which computes the soot combustion rate in the One-Step and Two-Step models. The default value supplied by ANSYS Fluent (3.6363) is for combustion of propane (\( \text{C}_3\text{H}_8 \)) by oxygen (\( \text{O}_2 \)).

Mass of Incipient Soot Particle

is \( M_p \) in Equation 14.142 and Equation 14.144, which is used in the Moss-Brookes and Moss-Brookes-Hall model computations. The default value supplied by ANSYS Fluent (144 kg/mol) is the mass of 12 carbon atoms. Note that for the original implementation of the Hall extension, the model assumed this mass to be 100 carbon atoms.

Soot Oxidation Model

contains model options that determine the form of the soot oxidation term in the calculations of the Moss-Brookes and Moss-Brookes-Hall models.

Fenimore-Jones

takes into account the soot oxidation due to the hydroxyl radical.

Lee

takes into account the soot oxidation due to the hydroxyl radical and molecular oxygen.

User Defined

enables you to select a user-defined function for soot oxidation rate. This selection is available when using the Moss-Brookes and Moss-Brookes-Hall models.

User Defined Oxidation Rate

allows you to hook the user-defined function to specify the soot oxidation rate. This selection is available when using the Moss-Brookes and Moss-Brookes-Hall models.

Model Parameters

contains parameters that control the soot formation model.

Soot Formation Constant

is the parameter \( C_s \) in Equation 14.128 in the Theory Guide. This item appears only for the One-Step soot model.

Equivalence Ratio Exponent

is the exponent \( r \) in Equation 14.128 in the Theory Guide. This item appears only for the One-Step soot model.

Equivalence Ratio Minimum

and Equivalence Ratio Maximum are the minimum and maximum values of the fuel equivalence ratio \( \phi \) in Equation 14.128 in the Theory Guide. Equation 14.128 will be solved only if \( \text{Equivalence Ratio Minimum} < \phi < \text{Equivalence Ratio Maximum} \); if \( \phi \) is outside of this range, there is no soot formation. This item appears only for the One-Step soot model.

Activation Temperature of Soot Formation Rate

is the term \( E/R \) in Equation 14.128 in the Theory Guide. This item appears only for the One-Step soot model.

Magnussen Constant for Soot Combustion

is the constant \( A \) in the rate expressions governing the soot combustion rate (Equation 14.130 and Equation 14.131) in the Theory Guide. This item appears only for the One-Step and the Two-
Step soot models. For the Two-Step model, this input will be called Magnussen Constant for Soot and Nuclei Combustion.

**Limiting Nuclei Formation Rate**

is the limiting value of the kinetic nuclei formation rate $\eta_0$ in Equation 14.137 in the Theory Guide. Below this limiting value, the branching and termination term, $(f - g)$ in Equation 14.136 in the Theory Guide, is not included. This item appears only for the Two-Step soot model.

**Nuclei Branching-Termination Coefficient**

is the term $(f - g)$ in Equation 14.136 in the Theory Guide. This item appears only for the Two-Step soot model.

**Nuclei Coefficient of Linear Termination on Soot**

is the term $g_0$ in Equation 14.136 in the Theory Guide. This item appears only for the Two-Step soot model.

**Pre-Exponential Constant of Nuclei Formation**

is the pre-exponential term $\alpha_0$ in the kinetic nuclei formation term, Equation 14.137 in the Theory Guide. This item appears only for the Two-Step soot model.

**Activation Temperature of Nuclei Formation Rate**

is the term $E/R$ in the kinetic nuclei formation term, Equation 14.137 in the Theory Guide. This item appears only for the Two-Step soot model.

**Alpha for Soot Formation Rate**

is $\alpha$, the constant in the soot formation rate equation, Equation 14.134 Two-Step soot model.

**Beta for Soot Formation Rate**

is $\beta$, the constant in the soot formation rate equation, Equation 14.134 in the Theory Guide. This item appears only for the Two-Step soot model.

**Magnussen Constant for Soot and Nuclei Combustion**

is the constant $\mathcal{A}$ used in the rate expressions governing the soot combustion rate (Equation 14.130 and Equation 14.131 in the Theory Guide). This item appears only for the One-Step and the Two-Step soot models.

**[OH] Model**

is a drop-down list that allows you to specify the method by which the OH radical concentration is calculated, that is, instantaneous or partial-equilibrium. This list appears only for the Moss-Brookes and the Moss-Brookes-Hall soot models.

**[O] Model**

is a drop-down list that specifies the method by which the O radical concentration is calculated, that is, equilibrium, partial-equilibrium, or instantaneous. This list appears only for the Moss-Brookes and the Moss-Brookes-Hall soot models, when you have selected partial-equilibrium for the [OH] Model.

**Important**

To use the concentration of OH or O predicted by the combustion model, select instantaneous for [OH] Model or [O] Model.
Options
contains an option for modeling the effect of soot on a variable radiation absorption coefficient. This group box will appear only when one of the radiation models in the Radiation Model Dialog Box (p. 1917) is active.

Soot-Radiation Interaction
enables the soot-radiation interaction model described in The Effect of Soot on the Absorption Coefficient in the Theory Guide.

35.4.33. Reactor Network Dialog Box

The Reactor Network dialog box allows you to set parameters related to the reactor network model and calculate the reactor network for species transport/combustion. See Reactor Network Model (p. 935) for details about using this dialog box.

Controls

Model
contains the option for enabling (or disabling) the reactor network model.

Reactor Network Model
enables/disables the modeling of the reactor network.
Options
contains the options for reactor network model. This portion of the dialog box appears only if Reactor Network Model is selected.

Import CHEMKIN Mechanism
allows you to import a detailed chemical mechanism in CHEMKIN format.

Detailed Mechanism Material Name
is a drop-down list of available mixture materials from which you can select a mixture material for your reactor network simulation.

Number of Reactors
sets the number of reactors in which cells are grouped based on specified criteria.

Solve Temperature
specifies whether or not the reactor network algorithm solves the temperature. By default, this option is selected.

Expert Option
when selected, displays the advanced options related to the solver settings.

Use Current Reactor Network
allows you to perform additional reactor network simulations with the existing network of connected reactors. This option can be enabled once the Fluent solver agglomerates cells and obtains the reactor-network solution.

Use Time Averaged Fields
enables you to select the time-averaged composition fields to be used for clustering reactors and the time-averaged velocity fields for calculating reactor mass flux matrix. This option is available only for unsteady simulations with enabled Data Sampling For Unsteady Statistics option.

Expert Options
contains advanced options for ODE solver and for reactor cell clustering control. This portion of the dialog box appears only if Expert Options is selected.

ODE Relative Error Tolerance
specifies relative error control for ODE integrator.

ODE Absolute Error Tolerance
specifies absolute error control for ODE integrator.

Reactor Network Convergence Tolerance
allows you to specify tolerance to control the accuracy of the reactor network calculations.

Solver
allows you to select the solver for your simulation. The default segregated solver typically converges faster than the coupled solver. However, if residuals stall above an acceptable tolerance, the coupled solver should be used.

Maximum Number of Iterations
(segregated solver only) sets the maximum number of solver iterations.

Maximum Integration Time
(coupled solver only) sets the maximum elapsed run time for ODE solver. ANSYS Fluent terminates the run at this time if the residuals fail to converge.
Use Custom Field Functions to Define Reactor Zones
 enables the use of custom field functions (Custom Field Functions (p. 1826)) for reactor network cell clustering.

Custom Field Functions
 contains the list of available user-defined field functions from which you can select the functions for reactor network cell clustering. This selection list will not appear if the Use Custom Field Functions to Define Reactor Zones option is not selected.

Calculate Reactor Network
 calculates a chemically reactive flow using reactor network model.

35.4.34. Decoupled Detailed Chemistry Dialog Box

The Decoupled Detailed Chemistry dialog box allows you to postprocess slowly-forming, trace pollutant species on a steady-state flow field using detailed chemical kinetic mechanisms.

Controls

Model
 includes the option to enable Decoupled Detailed Chemistry.

Import CHEMKIN Mechanism...
 opens the CHEMKIN Mechanism Import Dialog Box (p. 2385).

Integration Parameters...
 opens the Integration Parameters Dialog Box (p. 1961).

Original Species
 are the species that are in the original case setup.

Pollutant Species
 are typically slowly forming (far from chemical equilibrium), and occur at miniscule mass fractions.
35.4.35. Reacting Channel Model Dialog Box

The Reacting Channel Model dialog box allows you to solve reacting flow in shell and tube heat ex-changers with long and thin channels.

**Controls**

**Model**
includes the option to Enable Reacting Channel Model.

**Number of Boundary Groups**
allows you to group together channels with common flow direction, mixture materials, inlet compositions, temperature, pressure, and mass flow rate in cases where you have multiple channels.

**Flow Iterations per Coupling Iteration**
is the number of outer flow iterations for each channel flow iteration.
**Under-Relaxation Factor**

is used to update the heat flux from the reacting channel. See Equation 7.91 in the Theory Guide.

**Group Index**

is used to identify the boundary group.

**Group Settings**

contains **Group Settings** that you will set.

**Channel Walls in Group**

are wall boundary zones that correspond to the reacting channels in the group.

**Material**

is the group material.

**Import CHEMKIN Mechanism...**

opens the CHEMKIN Mechanism Import Dialog Box (p. 2385).

**Model Options**

allows you to enable **Surface Reactions** and **Porous Medium** models and set related parameters.

**Group Inlet Conditions**

is where you specify the **Temperature**, the **Flow Rate**, the **Pressure**, and other inlet conditions of the reacting channel group.

**Flow Direction**

is the X-, Y-, and Z-component of the flow at the inlets of the channels in the current group.

**Species Composition**

is where you will input the inlet mass fractions of the group.

**User Defined Inlet Conditions**

enables you to hook a user-defined function to specify the reacting channel inlet conditions. When this option is selected, the **User Defined Function** drop-down list becomes visible.

**Display Reacting Channel Variables**

opens the Reacting Channel 2D Curves Dialog Box (p. 1996) for postprocessing reacting channel variables.

### 35.4.36. Reacting Channel 2D Curves Dialog Box

The **Reacting Channel 2D Curves** dialog box allows you to display or write 2D curves of the reacting channel.
Controls

Options
  gives you the option to Plot, Report, or Write to File channel variables.

Group Index
  is used to identify the reacting channel boundary group.

Plot Reacting Channel Variables
  enables the plotting of reacting channel variables.

Report Reacting Channel Outlet Average
  enables the reporting of reacting channel outlet average.

Variable Name
  specifies the channel variable for plotting.

Variable Names
  contains a selectable list of channel variables for reporting.

Wall Surfaces
  contains a selectable list of wall surfaces on which you can plot, report or write the selected channel variables.

Plot
  generates an X-Y plot. The Plot button is available when Plot Reacting Channel Variables is selected. When the Write to File option is enabled, the Plot button changes to the Write... button.

Report
  generates the report of the channel variables. The Report button is available when Report Reacting Channel Outlet Average is selected. When the Write to File option is enabled, the Report button changes to the Write... button.
35.4.37. Discrete Phase Model Dialog Box

The **Discrete Phase Model** dialog box allows you to set parameters related to the calculation of a discrete phase of particles. See **Modeling Discrete Phase (p. 1131)** for details.

**Controls**

**Interaction**

contains parameters used for performing coupled calculations of the continuous and discrete phase flow. See **Procedures for a Coupled Two-Phase Flow (p. 1207)** for details.

**Interaction with Continuous Phase**

enables a coupled calculation of the discrete phase and the continuous phase.
**Update DPM Sources Every Flow Iteration**

enables calculation of particle source terms at every DPM iteration. It is recommended for unsteady simulations.

**Number of Continuous Phase Iterations per DPM Iteration**

allows you to control the frequency at which the particles are tracked and the DPM sources are updated.

**Contour Plots for DPM Variables**

contains options for enabling cell-averaged discrete phase variables for postprocessing.

**Mean Values**

enables additional cell-averaged discrete phase variables for postprocessing.

**RMS Values**

enables additional RMS values for several discrete phase variables for postprocessing.

**Particle Treatment**

contains options for choosing to treat the particles in an unsteady or a steady fashion.

**Unsteady Particle Tracking**

enables unsteady tracking of particles.

**Track with Fluid Flow Time Step**

enables the use of fluid flow time steps to inject the particles.

**Inject Particles at**

contains parameters to decide when to inject the particles for a new time step.

**Particle Time Step**

enables injection of particles for every particle time step.

**Fluid Flow Time Step**

enables injection of particles for every fluid flow time step. In any case, the particles will always be tracked in such a way that they coincide with the flow time of the continuous flow solver.

**Particle Time Step Size**

specifies particle time step size for the calculation.

**Number of Time Steps**

allows you to specify the number of time steps for the calculation.

**Clear Particles**

clears the particles that are currently in the domain.

**Tracking**

contains two parameters to control the time integration of the particle trajectory equations.

**Tracking Parameters**

contains parameters that control the tracking of particle trajectories. One simple rule of thumb to follow when setting the two parameters below is that if you want the particles to advance through a domain of length \( D \), the \textbf{Length Scale} times the number of \textbf{Max. Number of Steps} should be approximately equal to \( D \). See Integration of Particle Equation of Motion in the Theory Guide for details about the items below.
Max. Number of Steps
is the maximum number of time steps used to compute a single particle trajectory via integration of Equation 16.1 in the Theory Guide and Equation 16.50.

Specify Length Scale
when enabled allows you to specify the length scale.

Length Scale
controls the integration time step size used to integrate the equations of motion for the particle. It appears only when the Specify Length Scale option is enabled.

Step Length Factor
specifies the value of $\lambda$ in Equation 24.3 (p. 1141).

Physical Models
contains optional discrete phase models and their relevant parameters.

Options
contains additional models that can be included in the calculation. See Physical Models for the Discrete Phase Model (p. 1142) for more information.

Particle Radiation Interaction
includes the effect of radiation heat transfer to the particles (Equation 5.34 in the Theory Guide). You will also need to define additional properties for the particle materials (emissivity and scattering factor), as described in Description of the Properties (p. 1198).

This item appears only if the P-1 or discrete ordinates model is selected in the Radiation Model Dialog Box (p. 1917).

Thermophoretic Force
enables the inclusion of a thermophoretic force on the particles as an additional force term. See Thermophoretic Force in the Theory Guide for details.

Saffman Lift Force
enables the inclusion of Saffman's lift force (lift due to shear) as an additional force term. See Saffman's Lift Force in the Theory Guide for details.

Virtual Mass Force
enables the inclusion of virtual mass forces in the particle force balance. See Including the Virtual Mass Force and Pressure Gradient Effects on Particles (p. 1144) for details.

Pressure Gradient Force
enables the inclusion of pressure gradient effects in the particle force balance. See Including the Virtual Mass Force and Pressure Gradient Effects on Particles (p. 1144) for details.

Erosion/Accretion
enables the monitoring of erosion/accretion rates at wall boundaries. See Monitoring Erosion/Accretion of Particles at Walls (p. 1144) for details. This item appears only if Interaction with Continuous Phase is enabled.

Pressure Dependent Boiling
allows you to switch from droplet vaporization (Law 2) to boiling (Law 3), as described in Enabling Pressure Dependent Boiling (p. 1144).
Temperature Dependent Latent Heat
allows you to include the droplet temperature effects on the latent heat, as described in Equation 16.93 in the Theory Guide.

Two-Way Turbulence Coupling
enables the effect of change in turbulent quantities due to particle damping and turbulence eddies.

DEM Collision
allows you to model DEM collision as described in Modeling Collision Using the DEM Model (p. 1145).

Stochastic Collision
enables the effect of droplet collisions, as described in Collision and Droplet Coalescence Model Theory in the Theory Guide.

Coalescence
enables the effect of droplet coalescence, as described in Collision and Droplet Coalescence Model Theory in the Theory Guide. This option is available when the Stochastic Collision option is enabled.

Breakup
enables breakup for all suitable injections. You can select the breakup model and parameters, or disable breakup, for each injection in the Set Injection Properties Dialog Box (p. 2436).

DEM Collision Model
contains model settings which allow you to continue your setup of the model.

Adaptive Collision Mesh Width
is enabled by default. This adjusts the width of the collision mesh to the largest parcel diameter multiplied by the Edge Scale Factor.

Edge Scale Factor
is the factor by which the width of the collision mesh is adjusted to the largest parcel diameter.

Static Collision Mesh Width
is the fixed width of the collision mesh. This appears when the Adaptive Collision Mesh Width is disabled.

Maximum Particle Velocity
limits the maximum particle velocity to a physically plausible range.

DEM Collisions...
opens the DEM Collisions Dialog Box (p. 2004). This button is available at the bottom of the Discrete Phase Model dialog box when the DEM Collision model is enabled.

UDF
contains parameters that can be used to customize the discrete phase model using UDF. See the separate UDF Manual for details about user-defined functions.

User-Defined Functions
lists will show available user-defined functions that can be selected to customize the discrete phase model.

Body Force
contains a drop-down list of user-defined functions available for including additional body forces.
**Erosion/Accretion**
contains a drop-down list of user-defined functions available for incorporating non-standard erosion rate definitions. This item will appear only when the Erosion/Accretion option has been enabled.

**Scalar Update**
contains a drop-down list of user-defined functions available for calculating or integrating scalar values along the particle trajectory.

**Source**
contains a drop-down list of user-defined functions available for modifying interphase exchange terms.

**Spray Collide Function**
contains a drop-down list of user-defined functions available for modifying spray collide function.

**DPM Timestep**
contains a drop-down list of user-defined functions available for modifying DPM time step.

**User Variables**
lists the user input variables.

**Number of Scalars**
sets the number of scalar values used in the calculations with user-defined functions.

**Numerics**
tab gives you control over the numerical schemes for particle tracking as well as solutions of heat and mass equations. See Numerics of the Discrete Phase Model (p. 1151) for details.

**Tracking Options**
contains parameters of solutions of heat and mass equations.

**Accuracy Control**
enables the solution of equations of motion within a specified tolerance.

**Tolerance**
is the maximum relative error that has to be achieved by the tracking procedure.

**Max. Refinements**
is the maximum number of step size refinements in one single integration step. If this number is exceeded the integration will be conducted with the last refined integration step size.

**Track in Absolute Frame**
enables tracking the particles in the absolute reference frame.

**Tracking Scheme Selection**
contains parameters for selection of numerical schemes.

**Automated**
enables a mechanism to switch in an automated fashion between numerically stable lower order schemes and higher order schemes, which are stable only in a limited range.

**High Order Scheme**
can be chosen from the group consisting of **trapezoidal** and **runge-kutta** scheme.
Low Order Scheme
consists of implicit and the exponential analytic integration scheme.

Tracking Scheme
allows you to choose any of the tracking schemes. You also can combine each of the tracking schemes with Accuracy Control. It is selectable only if Automated is switched off.

Coupled Heat-Mass Solution
enables the solution of the corresponding equations using a coupled ODE solver with error tolerance control for the Droplet, Combusting, or Multicomponent particles. See Including Coupled Heat-Mass Solution Effects on the Particles (p. 1154) for details.

Vaporizing Limiting Factors
for the Mass and Heat are set at the default values of 0.3 and 0.1, respectively. See Including Coupled Heat-Mass Solution Effects on the Particles (p. 1154) for details.

Averaging
contains settings for node based averaging of DPM quantities. See Node Based Averaging of Particle Data (p. 1155) for details.

Enable Node Based Averaging
enables node based averaging and displays additional related options.

Average DPM Source Terms
enables averaging of source terms for the discrete phase.

Average in Each Integration Time Step
enables averages during each integration time step.

Average DDPM Variables
enables averaging of DDPM variables when the DDPM model is active.

Kernel Settings
contains settings for the kernel used by the node based averaging algorithm.

Averaging Kernel
selects the kernel to use for averaging

Gaussian Factor
sets the constant for the Gaussian distribution when gaussian is selected for Averaging Kernel.

Source Terms

Linearize Source Terms
enables the linearization of source terms for the discrete phase.

Parallel
contains parameters that control the compute nodes for performing discrete phase calculations in parallel. See Parallel Processing for the Discrete Phase Model (p. 1239) for details.
Methods
allows you to select the mode for parallel processing. This group box is editable only for the parallel version of ANSYS Fluent; for the serial version, the Shared Memory option (see the description that follows) is selected by default.

Message Passing
enables cluster computing and also works on shared memory machines. With this option, the compute node processes themselves perform the particle work on their local partitions and particle migration to other compute nodes is implemented using message passing primitives. No special requirements are placed on the host machine. Note that this model is not available if the Cloud Model option is enabled in the Turbulent Dispersion tab of the Set Injection Properties dialog box. The Message Passing option is irrelevant for the serial ANSYS Fluent code while the Shared Memory option remains valid.

Shared Memory
allows you to specify parameters for performing the calculations on shared-memory multiprocessor machines. Note that this option is not available on Windows 2000 or the nt x86 platform (32-bit Windows).

Hybrid
allows you to combine Message Passing (as previously described) and OpenMP for a dynamic load balancing without migration of cells. This option enables multicore cluster computing, and also works on shared-memory machines. When using the Hybrid option, you can control the maximum number of threads on each machine via the Thread Control dialog box (see Controlling the Threads (p. 1879) for details). Note that this option is not available for the nt x86 platform (32-bit Windows), nor is it available if the Cloud Model option is enabled in the Turbulent Dispersion tab of the Set Injection Properties dialog box.

Shared Memory Options
contains settings for the Shared Memory option. This group box is only available if Shared Memory is selected from the Methods list.

Workpile Algorithm
specifies that the discrete phase calculations are to be performed on a shared-memory multiprocessor machine.

Number of Threads
specifies the number of threads to be used in performing the particle calculations. By default, this parameter is equal to the number of compute nodes you specified for the parallel solver. (This item appears only if Workpile Algorithm is enabled.)

Hybrid Options
contains settings for the Hybrid option. This group box is only available if Hybrid is selected from the Methods list.

Use DPM Domain
enables the use of a separate computational domain for particle tracking which improves load balancing and scalability at the expense of some additional memory overhead.

35.4.38. DEM Collisions Dialog Box
The DEM Collisions dialog box allows you to manage the collision partners.
Controls

Collision Partners
contains a list from which you can select one or more collision partners in order to set, create, copy, rename, delete, or list.

Create
creates a new collision partner and opens the Create Collision Partner Dialog Box (p. 2005), in which you can enter the collision partner name.

Copy
creates a new injection with the same properties as the selected collision partner and opens the Copy Collision Partner Dialog Box (p. 2006).

Rename
allows you to change the name of the collision partner. It opens the Copy Collision Partner Dialog Box (p. 2006).

Delete
deletes the collision partner selected in the Collision Partners list.

List
lists the collision partners with their corresponding laws.

Set...
opens the DEM Collision Settings Dialog Box (p. 2006) for the collision partner selected in the Collision Partners list.

35.4.39. Create Collision Partner Dialog Box

The Create Collision Partner dialog box allows you to specify the name of the collision partner.
Controls

Name

is the name of the collision partner being created.

35.4.40. Copy Collision Partner Dialog Box

The **Copy Collision Partner** dialog box allows you to copy the selected collision partner.

Controls

Name

is the name of the new collision partner copied from the selected partner.

35.4.41. Rename Collision Partner Dialog Box

The **Rename Collision Partner** dialog box allows you to rename the selected collision partner.

Controls

Name

is the new name of the collision partner selected in the list.

35.4.42. DEM Collision Settings Dialog Box

The **DEM Collision Settings** dialog box allows you to specify the collision laws of the collision partners.
Controls

Collision Pair
contains the list of created collision partners.

Contact Force Laws
is where you will define the collisions laws.

Normal
allows you to choose between spring and spring-dashpot. You can also choose none if you do not want to include a contact force.

Tangential
allows you to include the friction-dhsf force law or to exclude it, in which case you would select none.

Constants
contains the list of contact force constants. Depending on the contact force law in effect, different constants will be visible.

35.4.43. Solidification and Melting Dialog Box

The Solidification and Melting dialog box allows you to set parameters related to the solidification/melting model. See Modeling Solidification and Melting (p. 1389) for details about the items below.
Controls

Model contains the option for turning on the model.

Solidification/Melting enables/disables the modeling of solidification and/or melting.

Options gives you the option of selecting one of two model rules.

Lever Rule allows you to use the Lever rule (Equation 18.14 in the Theory Guide).

Scheil Rule allows you to use the Scheil rule (Equation 18.18 in the Theory Guide). If you select Scheil Rule, then you can enable Back Diffusion. Enter either a constant or a user-defined function to specify the value of the Back Diffusion Parameter, used in Equation 18.19 to Equation 18.21 in the Theory Guide. Refer to DEFINE_SOLIDIFICATION_PARAMS of the UDF Manual for detailed information about the user-defined function.

Parameters contains parameters related to the solidification/melting model.

Mushy Zone Constant sets the value of $A_{mush}$ in Equation 18.6 in the Theory Guide.

Include Thermal Buoyancy includes the gravitational force due to the variation of density with temperature. Refer to Thermal and Solutal Buoyancy in the Theory Guide for more information.

Note

This option is available only when solidification is modeled with species transport.
Include Solutal Buoyancy
includes the gravitational force due to the variation of density with the change in the species composition of the melt. Refer to Thermal and Solutal Buoyancy in the Theory Guide for more information.

Note
This option is available only when solidification is modeled with species transport.

Include Pull Velocities
includes pull velocities in the model, as described in Momentum Equations and Pull Velocity for Continuous Casting in the Theory Guide.

Compute Pull Velocities
enables the calculation of pull velocities based on the specified velocity boundary conditions, as described in Pull Velocity for Continuous Casting in the Theory Guide. This option appears when Include Pull Velocities is turned on.

Flow Iterations per Pull Velocity Iteration
specifies the number of times the pull velocity equations will be solved after each iteration of the solver. This option appears when Compute Pull Velocities is turned on.

35.4.44. Acoustics Model Dialog Box

The Acoustics Models dialog box allows you to set parameters related to the acoustics model. See Using the Ffowcs-Williams and Hawking Acoustics Model (p. 1113) for details about the items below.
Model contains the option for turning on the acoustics model.

- **Off**
  disables the acoustics model.

- **Ffowcs-Williams & Hawking**
  enables the Ffowcs Williams and Hawkings (FW-H) acoustics model. See Postprocessing the FW-H Acoustics Model Data (p. 1125) for details.

- **Broadband Noise Sources**
  enables the broadband noise acoustics model. See Using the Broadband Noise Source Models (p. 1128) for details.

Export Options contains the parameters related to Ffowcs-Williams & Hawking model.

- **Export Acoustic Source Data in ASD Format**
  enables/disables the saving of source data files in ASD format.

- **Export Acoustic Source Data in CGNS Format**
  enables/disables the saving of source data files in CGNS format.

- **Compute Acoustics Signals Simultaneously**
  enables “on-the-fly” calculation of sound. When this option is chosen, the ANSYS Fluent console window will print a message at the end of each time step indicating that the sound pressure signals have been computed (for example, Extracting sound signals at x receiver locations..., where x is the number of receivers you specified). Enabling this option instructs ANSYS Fluent to compute sound pressure signals at the end of each time step, which will slightly increase the computation time.

Ffowcs-Williams & Hawking Options contains the Convective Effects option, which should be enabled for all cases dealing with external flows around bodies. When this option is enabled, you will need to specify the proper Free Stream Velocity and Free Stream Direction.

- **Define Sources...**
  opens the Acoustic Sources Dialog Box (p. 2011), which allows you to specify the acoustics sources.

- **Define Receivers...**
  opens the Acoustic Receivers Dialog Box (p. 2013), which allows you to specify the location of the receivers.

Model Constants contains parameters related to the acoustics model.

- **Far-Field Density**
  sets the value of the far-field fluid density ($\rho_0$ in Equation 15.1 in the Theory Guide).

- **Far-Field Sound Speed**
  sets the speed of the sound at the far-field ($a_0$ in Equation 15.5 and Equation 15.6 in the Theory Guide).
Free Stream Velocity
is available when the Convective Effects option for the Ffowcs-Williams & Hawking model is enabled.

Free Stream Direction
is available when the Convective Effects option for the Ffowcs-Williams & Hawking model is enabled.

Reference Acoustic Pressure
is used to calculate the sound pressure level in dB.

Reference Acoustic Power
is used to non-dimensionalize the acoustic power, giving the sound pressure level in dB (see Fast Fourier Transform (FFT) Postprocessing (p. 1731)). This parameter is equal to \( 4 \times 10^{-10} \) W for airborne sound and \( 10^{-12} \) W for underwater sound.

Reference Acoustic Intensity
is defined as \( P_{ref}^2 / (\rho_0 a_0) \), although this quantity is not currently used by ANSYS Fluent.

Source Correlation Length
is required when sound is to be computed using a 2D flow result. The FW-H integrals will be evaluated over this length in the depthwise direction using the identical source data.

Number of Realizations
is the number of times the noise source terms will be computed through the generation of stochastic turbulent velocity field.

Number of Fourier Modes
is the number of terms in the Fourier summation from which the turbulent velocity field and its derivatives are computed.

Number of Time Steps Per Revolution
is available only for steady-state cases that have a single moving reference frame. Here you will specify the number of equivalent time steps that it will take for the rotating zone to complete one revolution.

Number of Revolutions
is available only for steady-state cases that have a single moving reference frame. Here you will specify the number of revolutions that will be simulated in the model.

Apply
saves the acoustics model settings.

35.4.45. Acoustic Sources Dialog Box

The Acoustic Sources dialog box allows you to specify the acoustics sources. See Using the Ffowcs-Williams and Hawking Acoustics Model (p. 1113) for details about the items below.
Controls

Source Zones
contains a list of zones from which you can select one or more emission (source) surfaces.

Type
contains a list of all possible types of zones from which you can select one or more types of the available zones. If you select an available type of zone, the relevant zones will then be selected in the Source Zones list. If you specify any valid interior zones as source surfaces, the Interior Cell Zone Selection Dialog Box (p. 2014) will appear.

Source Data Root File Name
is used to give the names of the source data files (for example, acoustic_example_xxxx.asd, where xxxx is the global time-step index of the transient solution) and an index file (for example, acoustic_example.index) that will store the information associated with the source data.

Write Frequency
allows you to control how often the source data will be written. This will enable you to save disk space if the time-step size used in the transient flow simulation is smaller than necessary to resolve the sound frequency you are attempting to predict.

Number of Time Steps per File
allows you to write the source data to multiple files, each containing the source data for a number of time steps specified by you.

Receivers...
opens the Acoustic Receivers Dialog Box (p. 2013), which allows you to specify the location of the receivers.
35.4.46. Acoustic Receivers Dialog Box

The **Acoustic Receivers** dialog box allows you to specify the location of the acoustic receivers. See *Using the Ffowcs-Williams and Hawking Acoustics Model (p. 1113)* for details about the items below.

### Controls

**Moving Receivers**
- Allows you to specify the locations of the moving receivers.

**Moving Receiver Settings**
- Allows you to specify the **Velocity** and the **Direction** of the moving receivers.

**Number of Receivers**
- Allows you to specify the total number of receivers for which you want to compute sound.

**Name**
- Shows the name of the receiver. If you edit the field, the new name will take effect after you click the **OK** button.

**X-Coord., Y-Coord., Z-Coord.**
- Specifies the coordinates for each receiver. Note that because ANSYS Fluent's acoustics model is ideally suited for far-field noise prediction, the receiver locations you define should be at a reasonable distance from the sources of sound (that is, the selected acoustic surface), and can fall outside of the computational domain if needed.

**Signal File Name**
- Specifies the name of the file used to store sound pressure signals for the corresponding receivers. By default, the files will be named `receiver-1.dat`, `receiver-2.dat`, etc.
35.4.47. Interior Cell Zone Selection Dialog Box

The **Interior Cell Zone Selection** dialog box allows you to specify the acoustics sources. See [Specifying Source Surfaces (p. 1120)] for details about the items below.

### Controls

**Source Surface**
- displays the selected interior surface.

**Interior Cell Zone**
- contains a list of two interior cell zones, from which you will select the zone that is occupied by the quadrupole sources.

35.4.48. Eulerian Wall Film Dialog Box

The **Eulerian Wall Film** dialog box allows you to set various model and solution method controls for the Eulerian Wall Film model. For more information, see [Modeling Eulerian Wall Films (p. 1397)].
Controls

Eulerian Wall Film
enables/disables the use of the Eulerian Wall Film model in the calculations.

Model Options and Setup
contains controls for specific solution, discrete phase model (DPM), and material options for the Eulerian Wall Film model.

Solution Options
includes options for enabling/disabling the momentum equation and DPM calculations.

Solve Momentum
allows the momentum equation (see Equation 19.2 in the Theory Guide) to be solved.
Solve Energy
allows the energy equation (see Equation 19.3 in the Theory Guide) to be solved.

DPM Collection
allows for the effect of discrete particle streams or discrete particles hitting a face on a wall boundary that are then absorbed into the film. Once enabled, the Particle Splashing, Particle Stripping, and Edge Separation options become available (see DPM Collection in the Theory Guide).

Particle Splashing
(available when DPM Collection is enabled) allows you to set the number of Splashed Particles, under Splashing Options.

Particle Stripping
(available when DPM Collection is enabled) allows you to set the Critical Shear, Diameter Coefficient, and Mass Coefficient, available under Stripping Options.

Edge Separation
(available when DPM Collection is enabled) allows you to set the Critical Weber Number, Critical Angle, and Separation Model, available under Separation Options.

Treat Sharp Edge
allows you to set the Sharp Edge Angle when handling the effects of sharp edges and the wall film.

Phase Accretion
(available when the Eulerian Multiphase or Mixture (with Slip Velocity) model is enabled) allows for the interaction of the wall film with a secondary phase in a multiphase flow. Once enabled, the Phase Concentration and Phase Velocity can be set under Phase Accretion Options (see Secondary Phase Accretion in the Theory Guide).

Phase Change
allows you to account for phase changes between the film material (liquid) and the gas species (vapor). Once enabled, the Condensation Rate Constant and Vaporization Rate Constant can be set under Phase Change Options (see Coupling of Wall Film with Mixture Species Transport in the Theory Guide).

Momentum Options
are available when the Solve Momentum option is enabled.

Gravity Force
is the second term on the right hand side of Equation 19.2, and is responsible for accelerating the film in the direction of gravity component that is parallel to the wall.

Surface Shear Force
is the third term on the right hand side of Equation 19.2, and is responsible for accelerating the film in the direction of the external flow.

Pressure Gradient
is the first term on the right hand side of Equation 19.2, and is the term accelerating the film in the direction opposing the gradient in external pressure. For example, if a film on the surface of a wing is being modeled and there is a high pressure region at the leading edge with low pressure on the top of the wing, this term will tend to move a uniform film towards the low pressure region on the top of the wing.
**Spreading Term**
is the \( P_t \) term on the right hand side of Equation 19.2, and is responsible for spreading. This term will accelerate the flow in the direction opposing the gradient in height, moving the film towards regions of lower thickness. This term becomes available only when both **Pressure Gradient** and **Gravity Term** are selected.

**Surface Tension**
is the \( P_o \) term on the right hand side of Equation 19.2. This term becomes available only when **Pressure Gradient** is selected.

**Sharp Edge Angle**
allows you to account for sharp edges alongside the wall film, when the **Treat Sharp Edge** option is enabled.

**Material Options**
allows you to apply material properties to the wall film model.

**Film Material**
is the material assigned to the wall film.

**Film Vapor Material**
(available only when **Phase Change** is selected) is the material assigned to the wall film vapor.

**Surface Tension**
is the surface tension for the designated wall film material.

**Separation Options**
(available when **DPM Collection** and **Edge Separation** are enabled) allows you set DPM particle separation options (see **Film Separation** in the **Theory Guide**).

**Critical Weber Number**
is the critical value for the Weber number.

**Separation Angle**
is the critical angle, \( \theta \), that separation occurs.

**Separation Model**
allows you to specify one of three different models to calculate the number and diameter of the shed particle stream at an edge once separation occurs. Available models include: **Foucart** (the default, see **Foucart Separation** in the **Theory Guide**), **O'Rourke** (see **O'Rourke Separation**), and **Friedrich** (see **Friedrich Separation**).

**Random Separation**
(available when **DPM Collection** and **Edge Separation** are enabled) allows the random selection of the locations at which the newly spawn particles are injected (due to film separation) along the edge at which the separation takes place.

**Stripping Options**
(available when **DPM Collection** and **Particle Stripping** are enabled) allows you set DPM particle stripping options (see **Film Stripping** in the **Theory Guide**).

**Critical Shear**
is the critical value of the shear rate on the face where liquid film exists, which, when exceeded, causes mass to be taken from the film.
Diameter Coefficient
is the value of $f$ used in Equation 19.20 in the Theory Guide.

Mass Coefficient
is the value of $C$ used in Equation 19.21 in the Theory Guide.

Splashing Options
(available when DPM Collection and Particle Splashing are enabled) allows you set DPM particle splashing options (see Film Sub-Models in the Theory Guide).

Splashed Particles
is the number of splashed discrete particles.

Phase Accretion Options
(available when Phase Accretion is enabled) allows you to set secondary phase accretion options (see Secondary Phase Accretion in the Theory Guide).

Phase Concentration
is the value of $C_{d}$ used in Equation 19.24 in the Theory Guide.

Phase Velocity
is the value of $V_{d}$ used in Equation 19.24 in the Theory Guide.

Phase Change Options
(available when Phase Change is enabled) allows you to set phase change options (see Coupling of Wall Film with Mixture Species Transport in the Theory Guide).

Condensation Rate Constant
is the value of $C_{con}$ used in Equation 19.28 in the Theory Guide.

Vaporization Rate Constant
is the value of $C_{vap}$ used in Equation 19.28 in the Theory Guide.

Solve Wall Film
allows you to skip the wall film solution during the gas phase solution, but keep the variables and setup active.

Initialize
allows you to initialize the wall film variables and prepare the solver for the solution procedure. The film cannot be solved without first initializing the wall film model.

Solution Method and Control
contains controls for temporal or spatial discretization as well as wall film thickness for the Eulerian Wall Film model.

Discretization
allows you to set the temporal or spatial discretization methods.

Time
allows you to specify the temporal discretization methods. Available options include: First Order Explicit, First Order Implicit, or Second Order Implicit.
Continuity
allows you to specify the spatial discretization methods for continuity. Available options include:
First Order Upwind, or Second Order Upwind.

Momentum
allows you to specify the spatial discretization methods for momentum. Available options include:
First Order Upwind, or Second Order Upwind.

Energy
allows you to specify the spatial discretization methods for momentum. Available options include:
First Order Upwind, or Second Order Upwind.

Thickness Control
allows you to specify maximum and minimum values for the film thickness.

Maximum Thickness
is the maximum film thickness.

Minimum Thickness
is the minimum film thickness.

Time Marching and Time Step Control
allows you to set the number of sub-steps that the film model will take between time steps from the main solver. For example, if the flow time step is 0.001 seconds and the number of time steps is set to 10 in the film model, the film model will take 10 time steps of 0.0001 so that the film time and the flow time match at the end of the solution step. For implicit time stepping, the film model will take 5 additional sub iterations per implicit step, stopping the sub-step when the film residual drops below the value set in the Sub-Iteration Stop option.

Adaptive Time Stepping
(steady state flow) enables the adaptive time stepping method to determine the film time step \( (\Delta t) \) using the maximum Courant number and the initial time step (see Steady Flow in the Theory Guide).

Max. Courant Number
is the maximum value of the Courant number used to compute the film time step.

Initial Time Step
is an initial value for the time step used to compute the film time step.

Time-Step
(steady state flow; default) is the user-specified size of the time step, \( \Delta t \) (see Steady Flow in the Theory Guide).

Number of Time Steps
(transient flow) is \( N_{film} \) used in Equation 19.49 in the Theory Guide.

Sub-Iterations
(available when either First Order Implicit or Second Order Implicit are enabled for Time under Discretization) is the number of additional sub iterations per implicit step.
**Sub-Iteration Stop**
(available when either **First Order Implicit** or **Second Order Implicit** are enabled for **Time** under **Discretization**) is the point at which the sub iterations stop (when the film residual drops below this value).

**DPM Control**
(available when **DPM Collection** is enabled in the **Model Options and Setup** tab) allows you to specify DPM-specific discretization.

**Film Steps per DPM step**
allows you to set how often the DPM phase is calculated for the film.

### 35.5. Materials Task Page

The **Materials** task page allows you to set properties for any fluid or solid (or mixture, if applicable) materials in your ANSYS Fluent simulation.

35.5.43. Intrinsic Combustion Model Dialog Box
35.5.44. Multiple Surface Reactions Dialog Box
35.5.45. Edit Material Dialog Box
35.5.1. Create/Edit Materials Dialog Box

The **Create/Edit Materials** dialog box is used to create and modify materials. Materials can be downloaded from the global database or defined locally. See Physical Properties (p. 397) for details about defining material properties. Using the Materials Task Page (p. 399) describes how to use the dialog box.

![Create/Edit Materials Dialog Box]

**Controls**

**Name**
- shows the name of the material. If you edit this field, the new name will take effect when you click Change/Create.

**Chemical Formula**
- displays the chemical formula for the material. You should generally not edit this field unless you are creating a material from scratch.

**Material Type**
- is a drop-down list containing all of the available material types. By default, **fluid** and **solid** will be the only choices. If you are modeling species transport/combustion, **mixture** will also be available. For problems in which you have defined discrete-phase injections, **inert-particle**, **droplet-particle**, and/or **combusting-particle** will also appear.

**Fluent Fluid Materials**
- allows you to choose the fluid material for which you want to modify properties. This option is available when **fluid** is selected in the **Material Type** drop-down list.

**Fluent Solid Materials**
- allows you to choose the solid material for which you want to modify properties. This option is available when **solid** is selected in the **Material Type** drop-down list.
**Fluent Mixture Materials**
allows you to choose the mixture material for which you want to modify properties. This option is available when **mixture** is selected in the **Material Type** drop-down list.

**Fluent Droplet Particle Materials**
allows you to choose the droplet-particle for which you want to modify properties. This option is available when **droplet-particle** is selected in the **Material Type** drop-down list.

**Order Materials by**
allows you to order the materials in the **Materials** list alphabetically by **Name** or alphabetically by **Chemical Formula**.

**Fluent Database...**
opens the **Fluent Database Materials Dialog Box (p. 2030)**, from where you can copy materials from the global database into the current solver.

**User-Defined Database...**
opens the **Open Database Dialog Box (p. 2031)**, where you can specify the user-defined database to be used.

**Properties**
contains input fields for the material properties that are required for the active physical models.

**Density**
sets the material density. You may set a constant value, or select one of the other methods from the drop-down list above the real number field. See **Density (p. 416)** for instructions on setting density.

**Cp (Specific Heat)**
sets the constant-pressure specific heat of the material. You may set a constant value, or select one of the other methods from the drop-down list above the real number field. See **Specific Heat Capacity (p. 449)** for instructions on setting specific heat.

**Thermal Conductivity**
sets the thermal conductivity of the material. You may set a constant value, or select one of the other methods from the drop-down list above the real number field. See **Thermal Conductivity (p. 434)** for instructions on setting thermal conductivity.

**Viscosity**
sets the viscosity of the material. You may set a constant value, or select one of the other methods from the drop-down list above the real number field. See **Viscosity (p. 424)** for instructions on setting viscosity.

**Molecular Weight**
sets the molecular weight of the material. It is used to derive the gas constant of the material.

**Standard State Enthalpy**
specifies the formation enthalpy of a fluid material for a reacting flow. See **Standard State Enthalpies (p. 464)** for details.

**Standard State Entropy**
specifies the standard state entropy of a fluid material for a reacting flow. This input is used only if the fluid material is involved in a reversible reaction. See **Standard State Entropies (p. 464)** for details.

**Reference Temperature**
specifies the reference temperature for the **Heat of Formation**.
**L-J Characteristic Length**
specifies the kinetic theory parameter \( \sigma \) for a fluid material. See Kinetic Theory Parameters (p. 465) for details.

**L-J Energy Parameter**
specifies the kinetic theory parameter \( \varepsilon/\kappa \) for a fluid material. See Kinetic Theory Parameters (p. 465) for details.

**Absorption Coefficient**
specifies the absorption coefficient \( a \) for radiation heat transfer. See Radiation Properties (p. 451) for details. If you choose the wsggm-user-specified option from the drop-down list next to Absorption Coefficient, the WSGGM User Specified Dialog Box (p. 2063) will open. If you choose the user-defined-wsggm option from the drop-down list next to Absorption Coefficient, the User-Defined Functions Dialog Box (p. 2039) will open.

**Scattering Coefficient**
specifies the scattering coefficient \( \sigma_s \) for radiation heat transfer (only for the P-1, Rosseland, or DO radiation model). See Radiation Properties (p. 451) for details.

**Scattering Phase Function**
specifies an isotropic (by default) or linear-anisotropic scattering function. If you are using the DO model, delta-eddington and user-defined scattering functions are also available. See Radiation Properties (p. 451) for details. If you choose delta-eddington, the Delta-Eddington Scattering Function Dialog Box (p. 2064) will open.

**Refractive Index**
specifies the refractive index for the material. It is used only when semi-transparent media are modeled with the DO radiation model.

**Mixture Species**
specifies the names of the species that comprise a mixture material. To check or modify these names, click the Edit... button to open the Species Dialog Box (p. 2049). This property appears only for mixture materials.

**Reaction**
displays the reaction mechanism being used when you are modeling finite-rate reactions. finite-rate appears if LaminarFinite-Rate or Eddy-Dissipation Concept is selected in the Species Model Dialog Box (p. 1943), eddy-dissipation appears if Eddy-Dissipation is selected, and finite-rate/eddy-dissipation appears if Finite-Rate/Eddy-Dissipation is selected.

Click Edit... to open the Reactions Dialog Box (p. 2051).

**Mechanism**
allows you to enable different reactions selectively in different geometrical zones. Click the Edit button to open the Reaction Mechanisms Dialog Box (p. 2058). See Defining Zone-Based Reaction Mechanisms (p. 904) for details.

**Mass Diffusivity**
contains a drop-down list of available methods for specifying the diffusion coefficients for the species in a mixture material. If you select constant-dilute-apppx, you will enter a constant value in the field below. If you select dilute-approx or multicomponent, the Mass Diffusion Coefficients Dialog Box (p. 2060) will open, and you can specify the coefficients there. If you select kinetic-theory, you will need to specify the kinetic theory parameters for the individual fluid materials (species) that
comprise the mixture. See Mass Diffusion Coefficients (p. 454) for details about specifying mass diffusivity.

**Thermal Diffusion Coefficient**
contains a drop-down list of available methods for specifying the thermal diffusion coefficients for the species in a mixture material. If you select *kinetic-theory*, you will need to specify the kinetic theory materials (species) that comprise the mixture. If you select *specified*, the Thermal Diffusion Coefficients Dialog Box (p. 2062) will open, and you can specify the coefficients there. See Thermal Diffusion Coefficient Inputs (p. 458) for details about specifying thermal diffusion coefficients.

**Density of Unburnt Reactants**
sets the density \( \rho_u \) in Equation 9.68 in the Theory Guide) of the unburnt products.

**Temperature of Unburnt Reactants**
sets the temperature \( T_u \) in Equation 9.68 in the Theory Guide) of the unburnt products.

**Adiabatic Temperature of Burnt Products**
(only for adiabatic premixed combustion models) specifies the value of the burnt products under adiabatic conditions, \( T_{ad} \) in Equation 9.65 in the Theory Guide.

**Unburnt Thermal Diffusivity**
specifies the thermal diffusivity \( \alpha \) in Equation 9.9 in the Theory Guide) for use with the premixed combustion model. See Modeling Premixed Combustion (p. 1003) for details.

**Laminar Flame Speed**
specifies the value of \( U_f \) in Equation 9.9 in the Theory Guide.

**Laminar Flame Thickness**
specifies the thickness of the flame for which you have a choice of constant, user-defined, or diffusivity-over-flame-speed.

**Critical Rate of Strain**
specifies the value of \( g_{cr} \) in Equation 9.17 in the Theory Guide.

**Heat of Combustion**
(only for non-adiabatic premixed combustion models) specifies the value of \( H_{comb} \) in Equation 9.67 in the Theory Guide.

**Unburnt Fuel Mass Fraction**
(only for non-adiabatic premixed combustion models) specifies the value of \( Y_{fuel} \) in Equation 9.67 in the Theory Guide.

**Thermal Expansion Coefficient**
specifies the thermal expansion coefficient \( \beta \) in Equation 13.2 (p. 766)) for use with the Boussinesq approximation. See Steps in Solving Buoyancy-Driven Flow Problems (p. 766) for details.

**Droplet Surface Tension**
specifies the value of the droplet surface tension \( \sigma \) in Equation 16.234 in the Theory Guide).
Latent Heat
is the latent heat of vaporization, \( h_{fg} \), required for phase change from an evaporating liquid droplet or for the evolution of volatiles from a combusting particle. See Setting Material Properties for the Discrete Phase (p. 1193) for details.

Latent Heat at NBP
is the latent heat of vaporization at the normal boiling point, available for droplet-particles. See Using the Cubic Equation of State Models with the Lagrangian Dispersed Phase Models (p. 485) for details.

Normal Boiling Point (NBP)
is given by Equation 7.112 (p. 486). See Using the Cubic Equation of State Models with the Lagrangian Dispersed Phase Models (p. 485) for details.

Thermophoretic Coefficient
specifies the thermophoretic coefficient \( D_{T,p} \) in Equation 16.8 in the Theory Guide, and appears when the thermophoretic force is included in the discrete phase calculation.

Vaporization Temperature
is the temperature, \( T_{vap} \), at which the calculation of vaporization from a liquid droplet or devolatilization from a combusting particle is initiated by ANSYS Fluent. See Setting Material Properties for the Discrete Phase (p. 1193) for details.

Boiling Point
is the temperature, \( T_{byp} \), at which the calculation of the boiling rate equation is initiated by ANSYS Fluent. See Setting Material Properties for the Discrete Phase (p. 1193) for details.

Vapor-Particle-Equilibrium
is the selected approach for the calculation of the vapor concentration of the components at the surface. This can be Raoult's law (Equation 16.170 in the Theory Guide), the Peng-Robinson real gas model (Equation 16.178 in the Theory Guide), or a user-defined function that provides this value.

Volatile Component Fraction
\( (f_{vo}) \) is the fraction of a droplet particle that may vaporize via Laws 2 and/or 3 (Droplet Vaporization (Law 2) in the Theory Guide). For combusting particles, it is the fraction of volatiles that may be evolved via Law 4 (Devolatilization (Law 4) in the Theory Guide). See Setting Material Properties for the Discrete Phase (p. 1193) for details.

Binary Diffusivity
is the mass diffusion coefficient, \( D_{i, mr} \) used in the vaporization law, Law 2. This input is also used to define the mass diffusion of the oxidizing species to the surface of a combusting particle, \( D_{i,mr} \). See Setting Material Properties for the Discrete Phase (p. 1193) for details.

Saturation Vapor Pressure
is the saturated vapor pressure, \( P_{sat} \), defined as a function of temperature, which is used in the vaporization law, Law 2. See Setting Material Properties for the Discrete Phase (p. 1193) for details.

Heat of Pyrolysis
is the heat of the instantaneous pyrolysis reaction, \( h_{pyrol} \), that the evaporating/boiling species may undergo when released to the continuous phase. The heat of pyrolysis should be input as a positive number for exothermic reaction and as a negative number for endothermic reaction. The default
value of zero implies that the heat of pyrolysis is not considered. See Setting Material Properties for the Discrete Phase (p. 1193) for details.

**Vaporization Model**
defines which version of the vaporization model is used (Law 2). If you want to use the default diffusion controlled model, retain the selection of diffusion-controlled from the drop-down list to the right of Vaporization Model. This will apply Equation 16.84 in the Theory Guide.

To use the convection/diffusion controlled model for vaporization select convection/diffusion-controlled from the drop-down list. Equation 16.89 in the Theory Guide will be applied for the calculation of the vaporization rate, and Equation 16.96 in the Theory Guide will be applied in the particle heat transfer calculations. This model is recommended when evaporation rates are high. For slowly evaporating droplets both models are expected to give similar results.

**Degrees of Freedom**
specifies the kinetic theory parameter $f_i$, which is the number of nodes of energy storage. This parameter is required only if you are defining specific heat via kinetic theory. See Kinetic Theory Parameters (p. 465) for details.

**Particle Emissivity**
is the emissivity of particles in your model, $\varepsilon_{pr}$, used to compute radiation heat transfer to the particles when the P-1 or DO radiation model is active and particle radiation interaction is enabled in the Discrete Phase Model Dialog Box (p. 1998). See Setting Material Properties for the Discrete Phase (p. 1193) for details.

**Particle Scattering Factor**
is the scattering factor, $f_i$, due to particles in the P-1 or DO radiation model. Note that this property will appear only if particle radiation interaction is enabled in the Discrete Phase Model Dialog Box (p. 1998). See Setting Material Properties for the Discrete Phase (p. 1193) for details.

**Swelling Coefficient**
is the coefficient, $C_{sw}$, which governs the swelling of the coal particle during the devolatilization law, Law 4. A swelling coefficient of unity (the default) implies that the coal particle stays at constant diameter during the devolatilization process. See Setting Material Properties for the Discrete Phase (p. 1193) for details.

**Burnout Stoichiometric Ratio**
is the stoichiometric requirement, $S_{br}$, for the burnout reaction, in terms of mass of oxidant per mass of char in the particle. See Setting Material Properties for the Discrete Phase (p. 1193) for details.

**Combustible Fraction**
is the mass fraction of char, $f_{comb}'$, in the coal particle (the fraction of the initial combusting particle that will react in the surface reaction) Law 5. See Setting Material Properties for the Discrete Phase (p. 1193) for details.

**React. Heat Fraction Absorbed by Solid**
is the parameter $f_{hr'}$, which controls the distribution of the heat of reaction between the particle and the continuous phase. The default value of zero implies that the entire heat of reaction is released to the continuous phase. See Setting Material Properties for the Discrete Phase (p. 1193) for details.
Heat of Reaction for Burnout
is the heat released by the surface char combustion reaction, Law 5. This parameter is input in terms
of heat release (for example, Joules) per unit mass of char consumed in the surface reaction. See
Setting Material Properties for the Discrete Phase (p. 1193) for details.

Devolatilization Model
defines which version of the devolatilization model, Law 4, is being used. If you want to use the
default constant rate devolatilization model, retain the selection of constant in the drop-down list to
the right of Devolatilization Model and input the rate constant $A_0$ in the field below the list.

Choose single-rate, two-competing-rates, or cpd-model in the drop-down list to activate one
of the optional devolatilization models (the single kinetic rate model, two kinetic rates model,
or CPD model, as described in Devolatilization (Law 4) in the Theory Guide).

When the single kinetic rate model (single-rate) is selected, the Single Rate Devolatilization
Dialog Box (p. 2065) will appear; when the two competing rates model (two-competing-rates)
is selected, the Two Competing Rates Model Dialog Box (p. 2066) will appear; and when the CPD
model (cpd-model) is selected, the CPD Model Dialog Box (p. 2067) will appear.

See Setting Material Properties for the Discrete Phase (p. 1193) for details.

Combustion Model
defines which version of the surface char combustion law (Law 5) is being used. If you want to use
the default diffusion-limited rate model, retain the selection of diffusion-limited in the drop-down
list. No additional inputs are necessary, because the binary diffusivity defined above will be used in
Equation 16.144 in the Theory Guide.

To use the kinetics/diffusion-limited rate model for the surface combustion model, select kinetics/diffusion-limited in the drop-down list and enter the parameters in the resulting Kinetics/Diffusion-Limited Combustion Model Dialog Box (p. 2068).

To use the intrinsic model for the surface combustion model, select intrinsic-model in the drop-
down list and enter the parameters in the resulting Intrinsic Combustion Model Dialog Box (p. 2068).

To use the multiple surface reactions model, select multiple-surface-reactions in the drop-
down list.

See Setting Material Properties for the Discrete Phase (p. 1193) for details.

Pure Solvent Melting Heat
specifies the latent heat for the melting and solidification model ($L$ in Equation 18.3 in the Theory
Guide).

Solidus Temperature
specifies the solidus temperature for the melting and solidification model ($T_{\text{solidus}}$ in Equation 18.3
in the Theory Guide). If you are solving for species transport, the solidus temperature is $T_{\text{solidus}}$ in
Equation 18.8, and you specify the method by which it is calculated: either according to the mixing-
law (which is based on the parameters of the solutes) or a user-defined function.

Liquidus Temperature
specifies the liquidus temperature for the melting and solidification model ($T_{\text{liquidus}}$ in Equation 18.3
in the Theory Guide). If you are solving for species transport, the liquidus temperature is $T_{\text{liquidus}}$ in
Equation 18.9, and you specify the method by which it is calculated: either according to the mixing-law (which is based on the parameters of the solutes) or a user-defined function.

**Pure Solvent Melting Temperature**

specifies the melting temperature of pure solvent \( T_{melt} \) in Equation 18.8 and Equation 18.9 in the Theory Guide for the melting and solidification model when species transport has also been enabled. The solvent is the last species listed under the mixture material.

**Eutectic Temperature**

is the lowest alloy melting temperature, which depends on the relative proportions of the mixture composition of the Eutectic species mass fractions.

**Slope of Liquidus Line**

specifies the slope of the liquidus surface with respect to the concentration of the solute \( m_j \) in Equation 18.8 and Equation 18.9 in the Theory Guide. It is not necessary to specify this value for the solvent. Note that this option is available only for the melting and solidification model when species transport has also been enabled.

**Partition Coefficient**

specifies the partition coefficient with respect to the concentration of the solute fluid \( K_j \) in Equation 18.8 and Equation 18.9 in the Theory Guide. It is not necessary to specify this value for the solvent. Note that this option is available only for the melting and solidification model when species transport has also been enabled.

**Eutectic Mass Fraction**

is the mass fraction of a solute in an alloy at which the melting temperature of the alloy is the lowest possible value \( \gamma_i, Eut \) in Equation 18.10 in the Theory Guide. It is not necessary to specify this value for the solvent. Note that this option is available only for the melting and solidification model when species transport has also been enabled.

**Solutal Expansion Coefficient**

allows you to specify the coefficient in Equation 18.24 in the Theory Guide for all the species except the last one in the mixture. Note that this option is available only for the melting and solidification model when the Include Solutal Buoyancy option is enabled.

**Diffusion in Solid**

specifies the rate of diffusion in the solid. Note that this option is available only for the melting and solidification model when the Lever rule is selected and the species transport is enabled.

**UDS Diffusivity**

specifies the diffusion coefficient for a user-defined scalar. This material property is available in the Create/Edit Materials Dialog Box (p. 2022) when you specify one or more user-defined scalars in the User-Defined Scalars Dialog Box (p. 2456). If you select defined-per-uds, you will need to specify the diffusion coefficient for each user-defined scalar transport equation in the UDS Diffusion Coefficients Dialog Box (p. 2062).

When you are viewing the database, additional properties may be displayed. However, after you copy the material to the local area, only the properties with relevance to the current problem will be displayed.

**Change/Create**

changes the properties of a locally-stored material or creates a new one in the local area. If no material with the specified Name exists locally, ANSYS Fluent will create it. If you have modified the material
without changing its name, ANSYS Fluent will simply update the material with your modifications. If you have assigned a new name to the material and a material with this name already exists locally, an error will be indicated; you must then specify a different name or delete the existing material with that name before trying to save the new material.

Delete
 deletes the currently selected material from the local materials list. It has no effect on the global database.

35.5.2. Fluent Database Materials Dialog Box

The Fluent Database Materials dialog box is opened by clicking the Fluent Database... button in the Create/Edit Materials Dialog Box (p. 2022). In this dialog box you can view the global (site-wide) material properties database and copy materials list in the solver. See Copying Materials from the ANSYS Fluent Database (p. 401) for details.

Controls

Fluent Fluid Materials contains a list of all materials of the selected Material Type that are defined in the database. The name of this list will change depending on the selected material type (for example, fluid, solid, and so on). You can select one or more of these materials to be copied to the solver.
Material Type
is a drop-down list containing all of the available material types. By default, fluid and solid will be the only choices. If you are modeling species transport/combustion, mixture will also be available. For problems in which you have defined discrete-phase injections, inert-particle, droplet-particle, and/or combusting-particle will also appear.

Order Materials by
allows you to order the materials in the Materials list alphabetically by Name or alphabetically by Chemical Formula.

Copy Materials from Case...
opens the Copy Case Material Dialog Box (p. 2033).

Delete
deletes the selected materials from the database.

Properties
contains fields for the material properties that are defined for the selected material. These fields are for informational purposes only; they cannot be edited.

When you are viewing the database, not all properties displayed are relevant to your ANSYS Fluent solution. After you copy the material, only properties with relevance to the current physical models will be displayed.

Copy
copies the current material from the global database to the local materials list in the solver.

35.5.3. Open Database Dialog Box

The Open Database dialog box is opened by clicking the User-Defined Database button in the Create/Edit Materials Dialog Box (p. 2022).

Controls

Browse...
opens the The Select File Dialog Box (p. 15) where you can select the user-defined database to be used in the current solver session.

Database Name
allow you to enter the path and name of a new database. If you select an existing database, this filed displays the path and name of the selected database.
35.5.4. User-Defined Database Materials Dialog Box

The User-Defined Database Materials dialog box is opened by clicking OK in the Open Database Dialog Box (p. 2031). In this dialog box you can view the user-defined material properties database and copy materials list in the solver. See Viewing Materials in a User-Defined Database (p. 405) for details.

Controls

User-Defined Materials
contains a list of all materials of the selected Material Type that are defined in the database. The name of this list will change depending on the selected material type (for example, User-Defined Fluid Materials, User-Defined Solid Materials, and so on). You can select one or more of these materials to copy to your local list or edit their properties.

Material Type
is a drop-down list containing all of the available material types.

Order Materials By
allows you to order the materials in the User-Defined Materials list alphabetically by Name or alphabetically by Chemical Formula.

Copy Materials from Case...
opens the Copy Case Material Dialog Box (p. 2033).
Delete
 deletes the selected materials from the database.

Properties
 lists the properties and values of the selected material.

New...
 opens a blank Material Properties Dialog Box (p. 2033) where you can define a new material.

Edit...
 opens the Material Properties Dialog Box (p. 2033) displaying the properties of the selected material.

Save
 saves the information to the selected database.

Copy
 copies the selected material to your local material list. If the material already exists the New Material Name Dialog Box (p. 2035) opens.

35.5.5. Copy Case Material Dialog Box

This dialog box is opened by clicking the Copy Materials from Case... button in the User-Defined Database Materials Dialog Box (p. 2032).

Controls

Case Materials
 lists all the materials present in your local materials list.

Copy
 copies the selected materials to the user-defined database.

35.5.6. Material Properties Dialog Box

This dialog box is opened by clicking New... button in the User-Defined Database Materials Dialog Box (p. 2032). See Creating a New Materials Database and Materials (p. 408) for details.
## Controls

### Name
specifies the name of the material that you are creating.

### Formula
(optional) specifies the chemical formula of the material that you are creating.

### Types
allows you to select material type from fluid, solid, inter-particle, droplet-particle, combusting-particle, and mixture materials.

### Available Properties
lists properties applicable to the selected material type.

### Material Properties
lists properties that you have selected from Available Properties list.

### Edit...
opens Edit Property Methods Dialog Box (p. 2034) where you can edit the parameters that define a property.

### 35.5.7. Edit Property Methods Dialog Box
This dialog box is opened by clicking Edit... button in the Material Properties Dialog Box (p. 2033). See Creating a New Materials Database and Materials (p. 408) for details.
Controls

Property Name
specifies the name of the property that you want to edit.

Available Properties
specifies the methods that can be used to define the selected property.

Material Properties
lists properties that you have selected from Available Properties list.

Edit Properties
allows you to select the property that you want to edit.

35.5.8. New Material Name Dialog Box

This dialog box is opened by clicking the Copy button in the User-Defined Database Materials Dialog Box (p. 2032) when a material is already defined with the same name in the Create/Edit Materials Dialog Box (p. 2022).
Controls

New Name
allows you to enter the new name for the material you need to copy.

New Formula
allows you to enter the new formula for the material you need to copy.

35.5.9. Polynomial Profile Dialog Box

The Polynomial Profile dialog box allows you to define a physical property as a polynomial function of temperature. This dialog box will open when you select polynomial in the drop-down list next to a physical property in the Create/Edit Materials Dialog Box (p. 2022). See Inputs for Polynomial Functions (p. 412) for details about the items below.

![Polynomial Profile Dialog Box](image)

Controls

Define
shows the property that is being defined as a function of temperature.

In Terms of
shows the independent variable (Temperature). The property shown in Define will be defined as a polynomial function of temperature.

Coefficients
is an integer number entry that indicates the number of coefficients to be defined. You can define up to 8 coefficients.

Coefficients contains real number entries for the number of coefficients set in the Coefficients integer number entry above. The number of entries that are editable will be the same as the number of coefficients you requested.

35.5.10. Piecewise-Linear Profile Dialog Box

The Piecewise-Linear Profile dialog box allows you to define a physical property as a piecewise-linear function of temperature. This dialog box will open when you select piecewise-linear in the drop-down list next to a physical property in the Create/Edit Materials Dialog Box (p. 2022). See Inputs for Piecewise-Linear Functions (p. 413) for details about the items below.
Controls

Define
shows the property that is being defined as a function of temperature.

In Terms of
shows the independent variable (Temperature). The property shown in Define will be defined as a piecewise-linear function of temperature.

Points
indicates the number of data pairs that will define the piecewise distribution. You can define up to 50 pairs.

Data Points
contains entries for defining the data pairs.

Point
indicates the point for which the data pair (Temperature, Value) is being defined.

Temperature
is the independent variable.

Value
is the dependent variable (the property). In the example dialog box above, Viscosity is the variable being defined, as shown in the Define field.

35.5.11. Piecewise-Polynomial Profile Dialog Box

The Piecewise-Polynomial Profile dialog box allows you to define a physical property as a piecewise-polynomial function of temperature. This dialog box will open when you select piecewise-polynomial in the drop-down list next to a physical property in the Create/Edit Materials Dialog Box (p. 2022). See Inputs for Piecewise-Polynomial Functions (p. 415) for details about the items below.
### Controls

**Define**
- shows the property that is being defined as a function of temperature.

**In Terms of**
- shows the independent variable (Temperature). The property shown in Define will be defined as a polynomial function of temperature.

**Ranges**
- sets the number of temperature ranges for which you will define polynomial functions. You can define up to 3 ranges.

**Range**
- indicates the temperature range for which you are defining the polynomial function.

**Minimum, Maximum**
- set the minimum and maximum temperatures for the specified Range.

**Coefficients**
- is an integer number entry that indicates the number of coefficients to be defined for the specified Range. You can define up to 8 coefficients.

**Coefficients**
- contains real number entries for the number of coefficients set in the Coefficients integer number entry above. The number of entries that are editable will be the same as the number of coefficients you requested for the specified Range.

### 35.5.12. Compressible Liquid Dialog Box

The **Compressible Liquid** dialog box allows you to model liquid compressibility for high pressure applications using the Tait equation of state. This dialog box will open when you select **compressible-liquid** in the drop-down list next to one of the Properties in the Create/Edit Materials Dialog Box (p. 2022). See Compressible Liquid Density Method (p. 417) for details about using the items below.
35.5.13. User-Defined Functions Dialog Box

The User-Defined Functions dialog box allows you to choose which user-defined function is to be used to define a material property. This dialog box will open when you select **user-defined** in the drop-down list next to one of the Properties in the Create/Edit Materials Dialog Box (p. 2022). See the separate UDF Manual for details about user-defined functions.

The list will contain all available user-defined functions.
35.5.14. Sutherland Law Dialog Box

The Sutherland Law dialog box allows you to set the coefficients for Sutherland’s law for viscosity. This dialog box will open when you select sutherland in the drop-down list next to Viscosity in the Create/Edit Materials Dialog Box (p. 2022). See Sutherland Viscosity Law (p. 426) for details about the items below.

![Sutherland Law Dialog Box](image)

**Controls**

**Methods** contains options for selecting the Two Coefficient Method or the Three Coefficient Method.

**C1, C2**

set the coefficients \( C_1 \) and \( C_2 \) in Equation 7.22 (p. 426) in SI units. These inputs will appear if you select the Two Coefficient Method.

**Reference Viscosity**

sets the reference viscosity \( \mu_0 \) in Equation 7.23 (p. 426). This input will appear if you select the Three Coefficient Method.

**Reference Temperature**

sets the reference temperature \( T_0 \) in Equation 7.23 (p. 426). This input will appear if you select the Three Coefficient Method.

**Effective Temperature**

sets the effective temperature \( S \) in Equation 7.23 (p. 426). This input will appear if you select the Three Coefficient Method.

35.5.15. Power Law Dialog Box

The Power Law dialog box allows you to set the coefficients for the power law for viscosity. This dialog box will open when you select power-law in the drop-down list next to Viscosity in the Create/Edit Materials Dialog Box (p. 2022). See Power-Law Viscosity Law (p. 427) for details about the items below.
Controls

Methods contains options for selecting the Two Coefficient Method or the Three Coefficient Method.

B sets the coefficient $B$ in Equation 7.24 (p. 427) in SI units. This input will appear if you select the Two Coefficient Method.

Reference Viscosity sets the reference viscosity $\mu_0$ in Equation 7.25 (p. 427). This input will appear if you select the Three Coefficient Method.

Reference Temperature sets the reference temperature $T_0$ in Equation 7.25 (p. 427). This input will appear if you select the Three Coefficient Method.

Temperature Exponent sets the temperature exponent $n$ in Equation 7.24 (p. 427) or Equation 7.25 (p. 427), depending on your Method selection. If you are using the Two Coefficient Method, this input must be in SI units.

35.5.16. Non-Newtonian Power Law Dialog Box

The Non-Newtonian Power Law dialog box allows you to set the parameters for the non-Newtonian power law for viscosity. This dialog box will open when you select non-newtonian-power-law in the drop-down list next to Viscosity in the Create/Edit Materials Dialog Box (p. 2022). See Power Law for Non-Newtonian Viscosity (p. 431) for details about the items below.
**Controls**

**Methods**
- allows you to select the type of dependency on the viscosity.

**Shear Rate Dependent**
- is where the viscosity is dependent on the shear rate.

**Shear Rate and Temperature Dependent**
- is where the viscosity is dependent on the shear rate and the temperature.

**Consistency Index**
- sets the consistency index $k$ in Equation 7.37 (p. 431).

**Power-Law Index**
- sets the power-law index $n$ in Equation 7.37 (p. 431).

**Minimum Viscosity Limit, Maximum Viscosity Limit**
- set the minimum and maximum viscosity limits.

**Reference Temperature**
- sets the reference temperature.

**Activation Energy/R, alpha**
- is the ratio of the activation energy to the thermodynamic constant $\alpha$ in Equation 7.36 (p. 430).

### 35.5.17. Carreau Model Dialog Box

The Carreau Model dialog box allows you to set the parameters for the non-Newtonian Carreau model for viscosity. This dialog box will open when you select carreau in the drop-down list next to Viscosity in the Create/Edit Materials Dialog Box (p. 2022). See The Carreau Model for Pseudo-Plastics (p. 431) for details about the items below.
Controls

Methods
allows you to select the type of dependency on the viscosity.

Shear Rate Dependent
is where the viscosity is dependent on the shear rate.

Shear Rate and Temperature Dependent
is where the viscosity is dependent on the shear rate and the temperature.

Time Constant, lambda
sets the time constant $\lambda$ in Equation 7.38 (p. 431).

Power-Law Index
sets the power-law index $n$ in Equation 7.38 (p. 431).

Zero Shear Viscosity, Infinite Shear Viscosity
set the zero and infinite shear viscosity limits $\eta_0$ and $\eta_\infty$ in Equation 7.38 (p. 431).

Reference Temperature, $T_{alpha}$
sets the reference temperature $T_0$ in Equation 7.38 (p. 431).

Activation Energy/R, alpha
is the ratio of the activation energy to the thermodynamic constant $\alpha$ in Equation 7.36 (p. 430).

35.5.18. Cross Model Dialog Box
The Cross Model dialog box allows you to set the parameters for the non-Newtonian Cross model for viscosity. This dialog box will open when you select cross in the drop-down list next to Viscosity in the Create/Edit Materials Dialog Box (p. 2022). See Cross Model (p. 432) for details about the items below.
Controls

Methods
allows you to select the type of dependency on the viscosity.

Shear Rate Dependent
is where the viscosity is dependent on the shear rate.

Shear Rate and Temperature Dependent
is where the viscosity is dependent on the shear rate and the temperature.

Zero Shear Viscosity
sets the zero shear viscosity limit $\eta_0$ in Equation 7.39 (p. 432).

Power-Law Index
sets the power-law index $\eta$ in Equation 7.39 (p. 432).

Time Constant
sets the time constant $\lambda$ in Equation 7.39 (p. 432).

Reference Temperature, $T_{\alpha}$
sets the reference temperature $T_0$ in Equation 7.38 (p. 431).

Activation Energy/R, $\alpha$
is the ratio of the activation energy to the thermodynamic constant $\alpha$ in Equation 7.36 (p. 430).

35.5.19. Herschel-Bulkley Dialog Box

The Herschel-Bulkley dialog box allows you to set the parameters for the non-Newtonian Herschel-Bulkley model for viscosity. This dialog box will open when you select herschel-bulkley in the drop-down list next to Viscosity in the Create/Edit Materials Dialog Box (p. 2022). See Herschel-Bulkley Model for Bingham Plastics (p. 433) for details about the items below.
Controls

Methods
allows you to select the type of dependency on the viscosity.

**Shear Rate Dependent**
is where the viscosity is dependent on the shear rate.

**Shear Rate and Temperature Dependent**
is where the viscosity is dependent on the shear rate and the temperature.

**Consistency Index**
sets the consistency index \(k\) in Equation 7.41 (p. 433).

**Power-Law Index**
sets the power-law index \(n\) in Equation 7.41 (p. 433).

**Yield Stress Threshold**
sets the yield stress threshold \(\tau_0\) in Equation 7.41 (p. 433).

**Critical Shear Rate**
set the critical shear rate \(\gamma_C\) in Equation 7.41 (p. 433).

**Reference Temperature, T_alpha**
sets the reference temperature \(T_0\) in Equation 7.38 (p. 431).

**Activation Energy/R, alpha**
is the ratio of the activation energy to the thermodynamic constant \(\alpha\) in Equation 7.36 (p. 430).

### 35.5.20. Biaxial Conductivity Dialog Box

The **Biaxial Conductivity** dialog box allows you to define a biaxial orthotropic thermal conductivity, which is applicable to solid materials used for the wall shell conduction model. This dialog box will
open when you select **biaxial** in the drop-down list next to **Thermal Conductivity** in the Create/Edit Materials Dialog Box (p. 2022). See Biaxial Thermal Conductivity (p. 439) for details about the items below.

![Biaxial Conductivity](image)

**Controls**

**Planar Conductivity**

specifies the conductivity within the shell (or solid) region.

**Transverse Conductivity**

specifies the conductivity normal to the surface of the solid region.

### 35.5.21. Cylindrical Orthotropic Conductivity Dialog Box

The **Cylindrical Orthotropic Conductivity** dialog box allows you to define an orthotropic thermal conductivity in cylindrical coordinates. This dialog box will open when you select **cyl-orthotropic** in the drop-down list next to **Thermal Conductivity** in the Create/Edit Materials Dialog Box (p. 2022). See Cylindrical Orthotropic Thermal Conductivity (p. 442) for details about the items below.
**Cylindrical Orthotropic Conductivity**

**Axis Origin**
allows you to specify the origin of the cylindrical coordinate system.

X, Y
specify the X, Y and Z (for three dimensional system) coordinates.

**Axis Direction**
(3D only) allows you to specify the direction of the axis.

X, Y
specify 1 against the direction of the axis.

**Radial Conductivity**
specifies the conductivity in the radial direction.

**Tangential Conductivity**
specifies the conductivity in the tangential direction.

**Axial Conductivity**
(3D only) specifies the conductivity in the axial direction.
35.5.22. Orthotropic Conductivity Dialog Box

The Orthotropic Conductivity dialog box allows you to define an orthotropic thermal conductivity for a solid material. This dialog box will open when you select orthotropic in the drop-down list next to Thermal Conductivity in the Create/Edit Materials Dialog Box (p. 2022). See Orthotropic Thermal Conductivity (p. 440) for details about the items below.

![Orthotropic Conductivity Dialog Box](image)

**Controls**

**Direction 0 Components, Direction 1 Components**

specify the directions \( \hat{e}_0 \) and \( \hat{e}_1 \) in Equation 7.52 (p. 440) as \( X,Y,Z \) vectors. For 2D cases, only Direction 0 Components will appear.

**Conductivity 0, Conductivity 1, Conductivity 2**

specify \( k_{\hat{e}_0} \), \( k_{\hat{e}_1} \), and \( k_{\hat{e}_2} \) in Equation 7.52 (p. 440) as constant, polynomial, piecewise-linear, or piecewise-polynomial functions of temperature. For 2D cases, only Conductivity 0 and Conductivity 1 will appear.

**Edit...**

opens the appropriate dialog box for input of a temperature-dependent conductivity. (This button will be unavailable if you specify a constant conductivity.)
35.5.23. Anisotropic Conductivity Dialog Box

The **Anisotropic Conductivity** dialog box allows you to define a general anisotropic thermal conductivity. This dialog box will open when you select **anisotropic** in the drop-down list next to **Thermal Conductivity** in the [Create/Edit Materials Dialog Box](p. 2022). See [Anisotropic Thermal Conductivity](p. 438) for details about the items below.

![Anisotropic Conductivity Dialog Box](image)

**Controls**

**Matrix Components**

specify the components of the matrix $e_{ij}$ in Equation 7.51 (p. 438).

**Conductivity**

specifies the value of $k$ in Equation 7.51 (p. 438) as a **constant**, or as a **polynomial**, **piecewise-linear**, or **piecewise-polynomial** function of temperature.

**Edit...**

opens the appropriate dialog box for input of a temperature-dependent conductivity. (This button will be unavailable if you specify a **constant** conductivity.)

35.5.24. Species Dialog Box

The **Species** dialog box (opened by clicking the **Edit...** button next to **Mixture Species** in the [Create/Edit Materials Dialog Box](p. 2022))) allows you to define the species that comprise a mixture material. See [Defining the Species in the Mixture](p. 893) for details about the items below.

(Note that the **Species** dialog box is a modal dialog box, which means that you must tend to it immediately before continuing the property definitions.)
Controls

Mixture
shows the name of the mixture material for which you are defining the species. This field is not editable.

Available Materials
is a list of all of the materials to be a component in the mixture material by selecting it and clicking the Add button below the Selected Species or Selected Surface Species list. To add a material to the Available Materials list, use the Fluent Database Materials Dialog Box (p. 2030) to copy the fluid material to local storage.

Selected Species
is a list of all the fluid-phase species in the mixture. To add a material to the list, select it in the Available Materials list and click the Add button below the Selected Species list. To remove a material, select it in the Selected Species list and click Remove. See Overview of the Species Dialog Box (p. 894) for more information.

Selected Solid Species
is a list of all the solid species in the mixture. To add a material to the list, select it in the Available Materials list and click the Add button below the Selected Solid Species list. To remove a material, select it in the Selected Solid Species list and click Remove. See Overview of the Species Dialog Box (p. 894) for more information.

Selected Site Species
is a list of all the site species in the mixture. To add a material to the list, select it in the Available Materials list and click the Add button below the Selected Site Species list. To remove a material, select it in the Selected Site Species list and click Remove. See Overview of the Species Dialog Box (p. 894) for more information.
35.5.25. Reactions Dialog Box

The Reactions dialog box (opened by clicking the Edit... button next to Reaction in the Create/Edit Materials Dialog Box (p. 2022)) allows you to define the reactions that comprise a mixture material. See Defining Reactions (p. 896) for details about using this dialog box.

(Note that the Reactions dialog box is a modal dialog box, which means that you must tend to it immediately before continuing the property definitions.)

Controls

Mixture
shows the name of the mixture material for which you are defining the species. This field is not editable.

Total Number of Reactions
sets the total number of reactions (fluid-phase reactions and surface reactions occurring at wall boundaries). Use the arrows to change the value, or type in the value and press RETURN.

Reaction Name
contains the name of the reaction.
ID
sets the number of the reaction you want to define. (Again, if you type in the value be sure to press RETURN.)

Reaction Type
contains options that allow you to specify the type of reaction.

  Volumetric
  specifies, if enabled, that the current reaction is a volumetric reaction.

  Wall Surface
  specifies, if enabled, that the current reaction is a wall surface reaction.

  Particle Surface
  specifies, if enabled, that the current reaction is a particle surface reaction.

Number of Reactants
indicates the number of reactants in the specified reaction.

  Species
  contains drop-down lists of all species in the mixture. (The number of lists will be equal to the Number of Reactants.) Select each reactant in one of these lists.

  Stoich. Coefficient
  specifies the stoichiometric coefficient of the reactant species in the reaction.

  Rate Exponent
  specifies the rate constant for the reactant species in the reaction.

Number of Products
indicates the number of products in the specified reaction.

  Species
  contains drop-down lists of all species in the mixture. (The number of lists will be equal to the Number of Products.) Select each product in one of these lists.

  Stoich. Coefficient
  specifies the stoichiometric coefficient of the product species in the reaction.

  Rate Exponent
  specifies the rate constant for the product species in the reaction.

Arrhenius Rate
contains inputs related to the Arrhenius rate. (If you have chosen Eddy-Dissipation for the Turbulence-Chemistry Interaction in the Species Model Dialog Box (p. 1943), these inputs are not required.)
Pre-exponential Factor
is the constant \( A_r \) in Equation 7.10 in the Theory Guide. The units of \( A_r \) depend on the other rate constant inputs, but must be defined such that the units of the reaction rate \( R_{i,r} \) (Equation 7.5 in the Theory Guide) are in \((\text{kg/m}^3 \cdot \text{s})\) if you are using SI units.

**Important**

It is important to note that if you have selected the British units system, the Arrhenius factor should still be input in SI units. This is because ANSYS Fluent applies no conversion factor to your input of \( A_r \) (the conversion factor is 1.0) when you work in British units, as the correct conversion factor depends on your inputs for \( v_{j,r} \beta_{j,r} \) and so on.

Activation Energy
is the constant \( E_r \) in the forward rate constant expression, Equation 7.10 in the Theory Guide).

Temperature Exponent
is the value for the constant \( \beta_{r} \) in Equation 7.10 in the Theory Guide.

Include Backward Reaction
specifies that the reaction is reversible. By default, the backward reaction rate constant will be computed from Equation 7.10 in the Fluent Theory Guide. You can specify your own backward reaction rate parameters in the Backward Reaction Parameters Dialog Box (p. 2054). In this case, the backward reaction rate constant will be computed from Equation 7.15 in the Fluent Theory Guide.

Third-Body Efficiencies
enables the input and use of third-body efficiencies (\( v_{j,r} \beta_{j,r} \) in Equation 7.9 in the Theory Guide). These inputs are optional. (This item is available only if you have selected Volumetric for the Reaction Type.)

Pressure-Dependent Reaction
enables the modeling of a pressure fall-off reaction. See Inputs for Reaction Definition (p. 896) Laminar Finite-Rate or Eddy-Dissipation Concept for the Turbulence-Chemistry Interaction in the Species Model Dialog Box (p. 1943) and have selected Volumetric for the Reaction Type.)

Coverage-Dependent Reaction
is used when modeling Wall Surface reactions with site-balancing and reaction rates depend on site coverages.

Specify...
opens the Backward Reaction Parameters Dialog Box (p. 2054), Third-Body Efficiencies Dialog Box (p. 2055), the Pressure-Dependent Reaction Dialog Box (p. 2055), or Coverage-Dependent Reaction Dialog Box (p. 2057) in which you can specify the backward rate parameters for the reversible reaction, third-body efficiencies, pressure-dependent reaction parameters, or coverage parameters.

Mixing Rate
contains inputs related to the mixing rate. (If you have chosen Laminar Finite-Rate or Eddy-Dissipation Concept for the Turbulence-Chemistry Interaction in the Species Model Dialog Box (p. 1943), these inputs are not required.)
A is the constant \( A \) in the turbulent mixing rate (Equation 7.26 and Equation 7.27 in the Theory Guide) when it is applied to a species that appears as a reactant in this reaction. The default setting of 4.0 is based on the empirically derived values given by Magnussen et al. [54] (p. 2560).

B is the constant \( B \) in the turbulent mixing rate (Equation 7.27 in the Theory Guide) when it is applied to a species that appears as a product in this reaction. The default setting of 0.5 is based on the empirically derived values given by Magnussen et al. [54] (p. 2560).

**Particle Surface Reaction**
contains inputs related to a particle surface reaction. See User Inputs for Particle Surface Reactions (p. 924) for details. (This section will appear only if you have selected Particle Surface for the Reaction Type.)

**Diffusion Limited Species**
is a drop-down list that allows you to select the species for which the concentration gradient between the bulk and the particle surface is the largest when there is more than one gaseous reactant taking part in the particle surface reaction. See User Inputs for Particle Surface Reactions (p. 924) for details.

**Diffusion Rate Constant**
is the constant \( C_{1,r} \) in Equation 7.72 in the Theory Guide.

**Effectiveness Factor**
is the constant \( \eta_r \) in Equation 7.70 in the Theory Guide.

### 35.5.26. Backward Reaction Parameters Dialog Box

The Backward Reaction Parameters dialog box (opened by clicking Specify... next to Include Backward Reaction in the Reactions Dialog Box (p. 2051)) allows you to specify your custom backward rate parameters for a reversible reaction. See Inputs for Reaction Definition (p. 896) for details.

**Arrhenius Backward Rate**
enables the input of backward rate parameters.

**Pre-Exponential Factor**
is the constant \( A_{b,r} \) in Equation 7.15 in the Fluent Theory Guide.

**Activation Energy**
is the constant \( E_{b,r} \) in the backward rate constant expression in Equation 7.15 in the Fluent Theory Guide.
Temperature Exponent

is the constant $\beta_{b,r}$ in Equation 7.15 in the Fluent Theory Guide.

### 35.5.27. Third-Body Efficiencies Dialog Box

The **Third-Body Efficiencies** dialog box (opened by clicking Specify... next to the **Third-Body Efficiencies** button in the Reactions Dialog Box (p. 2051)) allows you to specify the third-body efficiencies for each species in the mixture, to be used in Equation 7.9 in the Theory Guide. See Defining Reactions (p. 896) for details.

(Note that the **Third-Body Efficiencies** dialog box is a modal dialog box, which means that you must tend to it immediately before continuing the property definitions.)

![Third-Body Efficiencies Dialog Box](image)

**Controls**

- **Species**
  - displays the name of each species in the mixture.

- **Third-body Efficiency**
  - specifies the third-body efficiency for each species.

### 35.5.28. Pressure-Dependent Reaction Dialog Box

The **Pressure-Dependent Reaction** dialog box (opened by clicking Specify... under **Pressure-Dependent Reaction** in the Reactions Dialog Box (p. 2051)) allows you to specify parameters for a pressure fall-off reaction. See Inputs for Reaction Definition (p. 896) for details.

(Note that the **Pressure-Dependent Reaction** dialog box is a modal dialog box, which means that you must tend to it immediately before continuing the property definitions.)
Controls

Reaction Parameters
contains inputs for specifying the type of pressure fall-off reaction and the reaction parameters. See Pressure-Dependent Reactions in the Theory Guide for details.

Reaction Type
contains a drop-down list of the available reaction types: lindemann, troe, and sri. See Pressure-Dependent Reactions in the Theory Guide for details.

Bath Gas Concentration
allows you to specify if the bath gas concentration ([M] in Equation 7.19 in the Theory Guide) is to be defined as the concentration of the mixture, or as the concentration of one of the mixture’s constituent species.

Chemically Activated Bimolecular Reaction
results in a net rate constant at any pressure being defined as Equation 7.25 in the Theory Guide.

Low Pressure Arrhenius Rate
contains inputs for specifying low-pressure Arrhenius parameters.

ln(Pre-exponential Factor)
is the natural logarithm of the constant $A_{low}$ in Equation 7.17 in the Theory Guide. The pre-exponential factor $A_{low}$ is often an extremely large number, so you will input the natural logarithm of this term.
**Activation Energy**

is the constant $E_{low}$ in Equation 7.17 in the Theory Guide.

**Temperature Exponent**

is the constant $\beta_{low}$ in Equation 7.17 in the Theory Guide.

**Troe parameters**

contains inputs for specifying parameters for the Troe method. See Pressure-Dependent Reactions in the Theory Guide for details. (This section of the dialog box will appear only if you have selected troe as the Reaction Type.)

**Alpha**

is the constant $\alpha$ in Equation 7.22 in the Theory Guide.

**T1**

is the constant $T_1$ in Equation 7.22 in the Theory Guide.

**T2**

is the constant $T_2$ in Equation 7.22 in the Theory Guide.

**T3**

is the constant $T_3$ in Equation 7.22 in the Theory Guide.

**SRI Parameters**

contains inputs for specifying parameters for the SRI method. See Pressure-Dependent Reactions in the Theory Guide for details. (This section of the dialog box will appear only if you have selected sri as the Reaction Type.)

**a**

is the constant $a$ in Equation 7.23 in the Theory Guide.

**b**

is the constant $b$ in Equation 7.23 in the Theory Guide.

**c**

is the constant $c$ in Equation 7.23 in the Theory Guide.

**d**

is the constant $d$ in Equation 7.23 in the Theory Guide.

**e**

is the constant $e$ in Equation 7.23 in the Theory Guide.

### 35.5.29. Coverage-Dependent Reaction Dialog Box

The **Coverage-Dependent Reaction** dialog box (opened by clicking on Specify... under Coverage-Dependent Reaction in the Reactions Dialog Box (p. 2051)) allows you to model Wall Surface reactions with site-balancing.

(Note that the **Coverage-Dependent Reaction** dialog box is a modal dialog box, which means that you must tend to it immediately before continuing the property definitions.)
Controls

Species are the site species of the reaction.

Eta is the surface coverage rate modification of the species and is defined in Equation 7.49 in the Theory Guide.

Mu is the surface coverage rate modification of the species and is defined in Equation 7.49 in the Theory Guide.

Eps is the surface coverage rate modification of the species and is defined in Equation 7.49 in the Theory Guide.

35.5.30. Reaction Mechanisms Dialog Box

The Reaction Mechanisms dialog box (opened by clicking the Edit... button next to Mechanism in the Create/Edit Materials Dialog Box (p. 2022)) allows you to select the reaction mechanism at a particular zone. See Mixture Materials (p. 887) for details about these methods and the related inputs.

(Note that the Reaction Mechanisms dialog box is a modal dialog box, which means that you must tend to it immediately before continuing the property definitions.)
Controls

**Number of Mechanisms**
- specifies the number of mechanisms present.

**Mechanism ID**
- is the ID of the mechanism that you specify.

**Name**
- allows you to enter a name for the mechanism.

**Reaction Type**
- specifies the type of reaction to be displayed for the mechanism.
  - **Volumetric**
    - displays all volumetric reactions under the **Reactions** list.
  - **Wall Surface**
    - displays all wall surface reactions under the **Reactions** list.
  - **Particle Surface**
    - displays all particle surface reactions under the **Reactions** list.
  - **All**
    - displays all types of reactions under the **Reactions** list.

**Reactions**
- displays the list of reactions of the category specified under **Reaction Type**.

**Number of Sites**
- specifies the number of sites at which you can specify the reaction.
Site Name
contains the name of the site.

Site Density
allows you to specify the site density of the species

Define...
opens the Site Parameters Dialog Box (p. 2060).

35.5.31. Site Parameters Dialog Box

The Site Parameters dialog box (opened by clicking the Define... button next to Site Density in the Reaction Mechanisms Dialog Box (p. 2058)) allows you to define the coverage for each site species.

![Site Parameters Dialog Box]

Controls

Site Name
displays the name of site.

Total Number of Site Species
specifies the total number of site species.

Site Species
allows you to select the site species.

Initial Site Coverage
allows you to specify the initial coverage of the site species.

35.5.32. Mass Diffusion Coefficients Dialog Box

The Mass Diffusion Coefficients dialog box (opened by clicking the Edit... button next to Mass Diffusivity in the Create/Edit Materials Dialog Box (p. 2022)) allows you to define the diffusion coefficients of the species in the mixture. Its contents will depend on the method you selected for Mass Diffusivity. See Mass Diffusion Coefficient Inputs (p. 460) for details about these methods and the related inputs.
(Note that the **Mass Diffusion Coefficients** dialog box is a modal dialog box, which means that you must tend to it immediately before continuing the property definitions.)

For the **dilute-approx** method:

![Mass Diffusion Coefficients dialog box](image)

**Controls**

**Species Di**
- contains a selectable list of all species in the mixture, from which you can select each species and specify its diffusion coefficient.

**Coefficient**
- sets the diffusion coefficient for the selected species in the mixture.

For the **multicomponent** method:

![Mass Diffusion Coefficients dialog box](image)
### Controls

**Species Di, Species Dj**
contain selectable lists of species in the mixture, from which you can select each pair of species and specify the diffusion coefficient of the selected *Species Di* in the selected *Species Dj*.

**Coefficient**
sets the diffusion coefficient for *Species Di* in *Species Dj* (which is equivalent to the diffusion coefficient for *Species Dj* in *Species Di*).

### 35.5.33. Thermal Diffusion Coefficients Dialog Box

The **Thermal Diffusion Coefficients** dialog box (opened by clicking the *Edit...* button next to *Thermal Diffusion Coefficient* in the Create/Edit Materials Dialog Box (p. 2022) allows you to define the thermal diffusion coefficients of the species in the mixture. See Thermal Diffusion Coefficient Inputs (p. 458) for details about these methods and the related inputs.

(Note that the **Thermal Diffusion Coefficients** dialog box is a modal dialog box, which means that you must tend to it immediately before continuing the property definitions.)

![ThermalDiffusion Coefficients Dialog Box](image)

**Controls**

**Species Thermal Di**
contains a selectable list of all species in the mixture, from which you can select each species and specify its thermal diffusion coefficient.

**Coefficient**
sets the thermal diffusion coefficient for the selected species in the mixture.

### 35.5.34. UDS Diffusion Coefficients Dialog Box

The **UDS Diffusion Coefficients** dialog box (opened by selecting *uds* and clicking the *Edit...* button next to *UDS Diffusivity* in the Create/Edit Materials Dialog Box (p. 2022)) allows you to define the diffusion coefficients for your user-defined scalar transport equations.
(Note that the **UDS Diffusion Coefficients** dialog box is a modal dialog box, which means that you must tend to it immediately before continuing the property definitions.)

**UDS Diffusion Coefficients**

User-Defined Scalar Diffusion

| uds-0
| uds-1
| uds-2
| uds-3

**Coefficient**

sets the diffusion coefficient for the selected user-defined scalar.

35.5.35. **WSGGM User Specified Dialog Box**

The **WSGGM User Specified** dialog box opens when you select *wsggm-user-specified* as the input method for a composition-dependent **Absorption Coefficient** in the Create/Edit Materials Dialog Box (p. 2022) and it allows you to define the path length for he weighted-sum-of-gray-gases model. See **Inputs for a Composition-Dependent Absorption Coefficient** (p. 452) for details.

**WSGGM User Specified**

| Path Length (m) | 0 |

**Controls**

**Path Length**

allows you to set the **Path Length** equal to a mean beam length that you have calculated outside of Fluent.
35.5.36. Gray-Band Absorption Coefficient Dialog Box

The **Gray-Band Absorption Coefficient** allows you to specify a different absorption coefficient in each gray band when you are modeling non-gray radiation with the P-1 model or the DO model (see The P-1 Model Equations or The DO Model Equations in the Theory Guide and Setting Up the P-1 Model with Non-Gray Radiation (p. 779) or Defining Non-Gray Radiation for the DO Model (p. 795)). This dialog box will open when you select **gray-band** in the drop-down list next to **Absorption Coefficient** in the Create/Edit Materials Dialog Box (p. 2022).

Controls

- **band n** specifies the absorption coefficient for the n-th gray band.

35.5.37. Delta-Eddington Scattering Function Dialog Box

The **Delta-Eddington Scattering Function** dialog box allows you to define the parameters used in the Delta-Eddington phase function for radiation scattering. This dialog box will open when you select **delta-eddington** in the drop-down list next to **Scattering Phase Function** in the Create/Edit Materials Dialog Box (p. 2022). See Anisotropic Scattering for details about the items below.

Controls

- **Forward Scattering Factor** specifies the value of $f$ in Equation 5.68 in the Theory Guide.

- **Asymmetry Factor** specifies the value of $C$ in Equation 5.68 in the Theory Guide.
35.5.38. Gray-Band Refractive Index Dialog Box

The **Gray-Band Refractive Index** allows you to specify a different refractive index in each gray band when you are modeling non-gray radiation with the P-1 model or the DO model (see *The P-1 Model Equations* or *The DO Model Equations* in the *Theory Guide* and *Setting Up the P-1 Model with Non-Gray Radiation* (p. 779) or *Defining Non-Gray Radiation for the DO Model* (p. 795)). This dialog box will open when you select *refractive-band* in the drop-down list next to *Refractive Index* in the *Create/Edit Materials Dialog Box* (p. 2022).

![Gray-Band Refractive Index Dialog Box](image)

**Controls**

**Band n**

specifies the refractive index for the *n*th gray band.

35.5.39. Single Rate Devolatilization Dialog Box

The **Single Rate Devolatilization Model** dialog box (which opens when you select *single-rate* as the *Devolatilization* in the *Create/Edit Materials Dialog Box* (p. 2022)) allows you to input the parameters used in the single kinetic rate devolatilization model. See *Devolatilization (Law 4)* in the *Theory Guide* for details.

Note that the **Single Rate Devolatilization Model** dialog box is a modal dialog box, which means that you must tend to it immediately before continuing the property definitions.
Controls

Pre-exponential Factor
sets the value of $A_1$ in Equation 16.107 in the Theory Guide for the computation of the kinetic rate.

Activation Energy

35.5.40. Two Competing Rates Model Dialog Box

The Two Competing Rates Model dialog box (which opens when you select two-competing-rates as the Devolatilization Model in the Create/Edit Materials Dialog Box (p. 2022) allows you to input the parameters used for each of the competing rates in the two-competing-rates devolatilization model. See Devolatilization (Law 4) in the Theory Guide for details.

Note that the Two Competing Rates Model dialog box is a modal dialog box, which means that you must tend to it immediately before continuing the property definitions.

Controls

First Rate
sets parameters for the first of the two rates.

Pre-exponential Factor
sets the value of $A_1$ in Equation 16.109 in the Theory Guide for the computation of the kinetic rate.
**Activation Energy**
sets the value of $E_1$ in *Equation 16.109* in the *Theory Guide* for the computation of the kinetic rate.

**Weighting Factor**
sets the value of $\alpha_1$ in *Equation 16.111* in the *Theory Guide*.

**Second Rate**
sets parameters for the second of the two rates.

**Pre-exponential Factor**
sets the value of $A_2$ in *Equation 16.110* in the *Theory Guide* for the computation of the kinetic rate.

**Activation Energy**
sets the value of $E_2$ in *Equation 16.110* in the *Theory Guide* for the computation of the kinetic rate.

**Weighting Factor**
sets the value of $\alpha_2$ in *Equation 16.111* in the *Theory Guide*.

### 35.5.41. CPD Model Dialog Box

The **CPD Model** dialog box (which opens when you select `cpd-model` as the **Devolatilization Model** in the *Create/Edit Materials Dialog Box* (p. 2022)) allows you to input the parameters used in the CPD devolatilization model. See *Devolatilization (Law 4)* in the *Theory Guide* for details.

Note that the **CPD Model** dialog box is a modal dialog box, which means that you must tend to it immediately before continuing the property definitions.

**Controls**

**Initial Fraction of Bridges in Coal Lattice**
sets the value of $p_0$ in *Equation 16.122* in the *Theory Guide*.

**Initial Fraction of Char Bridges**
sets the value of $\zeta_0$ in *Equation 16.121* in the *Theory Guide*.

**Lattice Coordination Number**
sets the value of $\sigma + 1$ in *Equation 16.133* in the *Theory Guide*.
Cluster Molecular Weight
sets the value of $M_{w,1}$ in Equation 16.133 in the Theory Guide.

Side Chain Molecular Weight
sets the value of $M_{w,\delta}$ in Equation 16.132 in the Theory Guide.

35.5.42. Kinetics/Diffusion-Limited Combustion Model Dialog Box

The Kinetics/Diffusion-Limited Combustion Model dialog box (which opens when you select kinetics/diffusion-limited as the Combustion Model in the Create/Edit Materials Dialog Box (p. 2022) allows you to input the parameters used for the kinetics/diffusion-limited rate surface combustion model. See Surface Combustion (Law 5) in the Theory Guide for details.

Note that the Kinetics/Diffusion-Limited Combustion Model dialog box is a modal dialog box, which means that you must tend to it immediately before continuing the property definitions.

![Kinetics/Diffusion-Limited Combustion Model Dialog Box](image)

Controls

Mass Diffusion-Limited Rate Constant
sets the value for $C_1$ in Equation 16.145 in the Theory Guide.

Kinetics-Limited Rate Pre-exponential Factor
sets the value for $C_2$ in Equation 16.146 in the Theory Guide.

Kinetics-Limited Rate Activation Energy
sets the value for $E$ in Equation 16.146 in the Theory Guide.

35.5.43. Intrinsic Combustion Model Dialog Box

The Intrinsic Combustion Model dialog box (which opens when you select intrinsic-model as the Combustion Model in the Create/Edit Materials Dialog Box (p. 2022) allows you to input the parameters used for the intrinsic surface combustion model. See Surface Combustion (Law 5) in the Theory Guide for details.

Note that the Intrinsic Combustion Model dialog box is a modal dialog box, which means that you must tend to it immediately before continuing the property definitions.
Controls

Mass Diffusion-Limited Rate Constant
sets the value for $C_1$ in Equation 16.145 in the Theory Guide.

Kinetics-Limited Rate Pre-exponential Factor
sets the value for $A_i$ in Equation 16.155 in the Theory Guide.

Kinetics-Limited Rate Activation Energy (J/kgmol)
sets the value for $E_i$ in Equation 16.155 in the Theory Guide.

Char Porosity
sets the value for $\theta$ in Equation 16.152 in the Theory Guide.

Mean Pore Radius (m)
sets the value for $\bar{r}_p$ in Equation 16.154 in the Theory Guide.

Specific Internal Surface Area (m2/kg)
sets the value for $A_s$ in Equation 16.149 and Equation 16.151 in the Theory Guide.

Tortuosity
sets the value for $\tau$ in Equation 16.152 in the Theory Guide.

Burning Mode, $\alpha$
sets the value for $\alpha$ in Equation 16.156 in the Theory Guide.

35.5.44. Multiple Surface Reactions Dialog Box

The Multiple Surface Reactions dialog box (which opens when you select multiple-surface-reactions as the Combustion Model in the Create/Edit Materials Dialog Box (p. 2022)) allows you to enable composition-dependent char properties when using the multiple surface reactions combustion model.
Controls

**Composition Dependent Specific Heat**

enables calculation of the char specific heat from the particle specific heat values. See Combustion Model (p. 1199) for details.

**Composition Dependent Density**

enables calculation of the char density from the particle density values. See Combustion Model (p. 1199) for details.

### 35.5.45. Edit Material Dialog Box

The **Edit Material** dialog box contains the portion of the Create/Edit Materials Dialog Box (p. 2022) that contains the properties for a specific material. It is opened from the Primary Phase Dialog Box (p. 2072), Secondary Phase Dialog Box (p. 2072), Wall Dialog Box (p. 2160), Fluid Dialog Box (p. 2085), or Solid Dialog Box (p. 2092).
Properties of material-n
contains a list of the properties of material-_n_. The items in the list are the same as those in the Create/Edit Materials Dialog Box (p. 2022).

Change
applies any changes you have made to the properties of the material.

35.6. Phases Task Page

The Phases task page allows you to define each of the phases and the interaction between them. See – Defining the Phases for the Eulerian Model (p. 1318) for details.

Controls

Phases
contains a list of all of the phases in the problem from which you can select the phase you want to define or modify. A phase can be a Primary Phase or a Secondary Phase. You cannot change a phase from primary to secondary, or vice versa. Instead, you can redefine the properties of the primary phase to reflect the new phase designated as primary, and redefine the secondary phases accordingly as well.

Edit...
opens either the Primary Phase Dialog Box (p. 2072) or the Secondary Phase Dialog Box (p. 2072), where you can define the properties of the selected primary or secondary phase.

Interaction...
opens the Phase Interaction Dialog Box (p. 2079), where you can define the interaction between the phases (for example, surface tension if you are using the VOF model, slip velocity functions if you are using the mixture model, or drag functions if you are using the Eulerian model).
ID
displays the ID number of the phase. You will need this number only if you are writing a user-defined
function. See the separate UDF Manual for details about writing user-defined functions for multiphase
applications.

For additional information, see the following sections:
35.6.1. Primary Phase Dialog Box
35.6.2. Secondary Phase Dialog Box
35.6.3. Discrete Phase Dialog Box
35.6.4. Phase Interaction Dialog Box

35.6.1. Primary Phase Dialog Box

The Primary Phase dialog box allows you to set the properties of the primary phase. It is opened from
the Phases Task Page (p. 2071). See Defining the Phases for the VOF Model (p. 1296) for details about the
items below.

![Primary Phase Dialog Box]

**Controls**

**Name**
specifies the name of the phase.

**Phase Material**
contains a drop-down list of available materials, from which you can select the appropriate one for this
phase.

**Edit...**
opens the Edit Material Dialog Box (p. 2070) for the selected Phase Material, where you can modify its
properties.

35.6.2. Secondary Phase Dialog Box

The Secondary Phase dialog box allows you to set the properties of a secondary phase. It is opened from
the Phases Task Page (p. 2071). The items that appear in the Secondary Phase dialog box will depend
on which multiphase model you are using. See Defining the Phases for the VOF Model (p. 1296), Defining
the Phases for the Mixture Model (p. 1308), and Defining the Phases for the Eulerian Model (p. 1318) for
details about the items below.
Controls

Name
specifies the name of the phase.

Phase Material
contains a drop-down list of available materials, from which you can select the appropriate one for the phase.

Edit...
opens the Edit Material Dialog Box (p. 2070) for the selected Phase Material, where you can modify its properties.

Granular
indicates whether or not this is a solid phase. This item appears only for the Eulerian model.

Packed Bed
indicates whether or not the granular phase is a packed bed. This option appears only if Granular is enabled.

Granular Temperature Model
lists the granular temperature models.
**Phase Property**

enables phase property model for granular temperature.

**Partial Differential Equation**

**Interfacial Area Concentration**

is used to predict mass, momentum and energy transfers through the interface between the phases. See [Interfacial Area Concentration](#) in the [Theory Guide](#) for details.

**Properties**

contains a list of phase-specific properties. This section of the dialog box will not appear for the VOF model. The Diameter appears for both the mixture model and the Eulerian model, but all of the others will appear only for a granular phase with the Eulerian model.

**Diameter**

specifies the diameter of the particles. You can select **constant** in the drop-down list and specify a constant value, or select **user-defined** to use a user-defined function. See the separate UDF Manual for details about user-defined functions.

**Granular Viscosity**

specifies the kinetic part of the granular viscosity of the particles ($\mu_{s,kin}$ in Equation 17.292 in the Theory Guide). You can select **constant** (the default) in the drop-down list and specify a constant value, select **syamlal-obrien** to compute the value using Equation 17.294 in the Theory Guide, select **gidaspow** to compute the value using Equation 17.295 in the Theory Guide, or select **user-defined** to use a user-defined function.

**Granular Bulk Viscosity**

specifies the solids bulk viscosity ($\dot{\lambda}_{q}$ in Equation 17.154 in the Theory Guide). You can select **constant** (the default) in the drop-down list and specify a constant value, select **lun-et-al** to compute the value using Equation 17.296 in the Theory Guide, or select **user-defined** to use a user-defined function.

**Frictional Viscosity**

specifies a shear viscosity based on the viscous-plastic flow ($\mu_{s,fr}$ in Equation 17.292 in the Theory Guide). By default, the frictional viscosity is neglected, as indicated by the default selection of **none** in the drop-down list. If you want to include the frictional viscosity, you can select **constant** and specify a constant value, select **schaeffer** to compute the value using Equation 17.297 in the Theory Guide, **johnson-et-al**, or select **user-defined** to use a user-defined function.

**Angle Of Internal Friction**

specifies a constant value for the angle $\phi$ used in Schaeffer’s expression for frictional viscosity (Equation 17.297 in the Theory Guide). This parameter is relevant only if you have selected **schaeffer**, **johnson-et-al**, or **user-defined** for the Frictional Viscosity.

**Frictional Pressure**

specifies the pressure gradient term, $\nabla P_{friction}$, in the granular-phase momentum equation. Choose **none** to exclude frictional pressure from your calculation, **johnson-et-al** to apply Equation 17.302 in the Theory Guide, **syamlal-et-al** to apply Equation 17.213 in the Theory Guide, **based-ktgf**, where the frictional pressure is defined by the kinetic theory [21] (p. 2558). The solids pressure tends to a large value near the packing limit, depending on the model selected for the radial distribution.
function. You must hook a user-defined function when selecting the **user-defined** option. See the separate UDF Manual for information on hooking a UDF.

**Frictional Modulus**

can be set as **derived**, or as a **user-defined** function. This is defined as Equation 25.7 (p. 1311).

**Friction Packing Limit**
specifies a threshold volume fraction at which the frictional regime becomes dominant. It is assumed that for a maximum packing limit of 0.6, the frictional regime starts at a volume fraction of about 0.5.

**Granular Conductivity**
specifies the solids conductivity. You can select **syamlal-obrien**, **gidaspow**, **constant** or **user-defined**.

**Granular Temperature**
specifies temperature for the solids phase and is proportional to the kinetic energy of the random motion of the particles. You can choose the **algebraic**, **constant**, **dpm-averaged**, **user-defined** option. **dpm-averaged** is available only when using the Dense Discrete Phase Model (DDPM).

**Solids Pressure**
specifies the pressure gradient term, $\nabla p_s$, in the granular-phase momentum equation. Choose either the **lun-et-al**, the **syamlal-obrien**, the **ma-ahmadi**, or the **user-defined** option.

**Radial Distribution**
specifies a correction factor that modifies the probability of collisions between grains when the solid granular phase becomes dense. Choose either the **lun-et-al**, the **syamlal-obrien**, the **ma-ahmadi**, the **arastapour**, or a **user-defined** option.

**Elasticity Modulus**
is defined as

$$G = \frac{\partial p_s}{\partial \alpha_s}$$

with $G \geq 0$.

Choose either the **derived** or **user-defined** options.

**Packing Limit**
specifies the maximum volume fraction for the granular phase ($\alpha_s, \text{max}$). For monodispersed spheres the packing limit is about 0.63, which is the default value in ANSYS Fluent. In polydispersed cases, however, smaller spheres can fill the small gaps between larger spheres, so you may need to increase the maximum packing limit.

**Surface Tension**
specifies the attractive forces between the interfaces.

**Coalescence Kernel**
allows you to specify the coalescence kernel. You can select **none**, **constant**, **hibiki-ishii**, **ishii-kim**, **yao-morel**, or **user-defined**. The three options, **hibiki-ishii**, **ishii-kim**, and **yao-morel** are described in detail in Interfacial Area Concentration in the Theory Guide.
Breakage Kernel
allows you to specify the breakage kernel. You can select none, constant, hibiki-ishii, ishii-kim, yao-morel, or user-defined. The three options, hibiki-ishii, ishii-kim, and yao-morel are described in detail in Interfacial Area Concentration in the Theory Guide.

Nucleation Rate
is a source term for the interfacial area concentration that models the rate of formation of the dispersed phase. You can choose from constant or user-defined. If the Boiling Model option is enabled when using the Eulerian multiphase model, you can also select yao-morel. The yao-morel option is described in Yao-Morel Model in the Theory Guide.

Critical Weber Number
will need to be specified if you selected yao-morel for the Breakage Kernel.

Dissipation Function
gives you the option to choose the formula which calculates the dissipation rate used in the hibiki-ishii and ishii-kim models. You can choose amongst constant, wu-ishii-kim, fluent-ke, and user-defined for the dissipation function.

Hydraulic Diameter
is the value used in Equation 25.9 (p. 1314). This is available when the wu-ishii-kim formulation is selected as the Dissipation Function.

Min/Max Diameter
are the limits of the bubble diameters.

35.6.3. Discrete Phase Dialog Box
The Discrete Phase dialog box allows you to set the properties of a discrete phase. It is opened from the Phases Task Page (p. 2071). The items will appear in the Discrete Phase dialog box when the Dense Discrete Phase Model option is enabled in the Multiphase Model dialog box. See Including the Dense Discrete Phase Model (p. 1343) for details about the items below.
**Controls**

**Name**
specifies the name of the phase.

**Volume Fraction Approaching Continuous Flow Limit**
appears for non-granular flows. When this option is enabled, only the **Transition Factor** must be specified.

**Volume Fraction Approaching Packing Limit**
prevents the unlimited accumulation of particles, which are operating at packing limit conditions.

**Granular**
indicates whether or not this is a solid phase. This item appears only for the Eulerian model.

**Granular Temperature Model**
lists the granular temperature models.

**Phase Property**
enables phase property model for granular temperature.

**Partial Differential Equation**
**Properties**
contains a list of phase-specific properties.

**Granular Viscosity**
specifies the kinetic part of the granular viscosity of the particles \( \mu_{s,\text{kin}} \) in Equation 17.292 in the Theory Guide. You can select **constant** (the default) in the drop-down list and specify a constant value, select **sylamobrien** to compute the value using Equation 17.294 in the Theory Guide, select **gidaspow** to compute the value using Equation 17.295 in the Theory Guide, or select **user-defined** to use a user-defined function.

**Granular Bulk Viscosity**
specifies the solids bulk viscosity \( \lambda_q \) in Equation 17.154 in the Theory Guide. You can select **constant** (the default) in the drop-down list and specify a constant value, select **lunet-al** to compute the value using Equation 17.296 in the Theory Guide, or select **user-defined** to use a user-defined function.

**Frictional Viscosity**
specifies a shear viscosity based on the viscous-plastic flow \( \mu_{s,fr} \) in Equation 17.292 in the Theory Guide. By default, the frictional viscosity is neglected, as indicated by the default selection of **none** in the drop-down list. If you want to include the frictional viscosity, you can select **constant** and specify a constant value, select **sylamobrien** to compute the value using Equation 17.297 in the Theory Guide, **johnsonet-al**, or select **user-defined** to use a user-defined function.

**Angle Of Internal Friction**
specifies a constant value for the angle \( \phi \) used in Schaeffer’s expression for frictional viscosity (Equation 17.297 in the Theory Guide). This parameter is relevant only if you have selected **sylamobrien**, **johnsonet-al**, or **user-defined** for the Frictional Viscosity.

**Frictional Pressure**
specifies the pressure gradient term, \( \nabla \mu_{fr} \) in the granular-phase momentum equation. Choose **none** to exclude frictional pressure from your calculation, **johnsonet-al** to apply Equation 17.302 in the Theory Guide, **sylamobrien** to apply Equation 17.213 in the Theory Guide, **basedktgf**, where the frictional pressure is defined by the kinetic theory [21] (p. 2558). The solids pressure tends to a large value near the packing limit, depending on the model selected for the radial distribution function. You must hook a user-defined function when selecting the **user-defined** option. See the separate UDF Manual for information on hooking a UDF.

**Frictional Modulus**
can be set as **derived**, or as a **user-defined** function. This is defined as Equation 25.7 (p. 1311).

**Friction Packing Limit**
specifies a threshold volume fraction at which the frictional regime becomes dominant. It is assumed that for a maximum packing limit of 0.6, the frictional regime starts at a volume fraction of about 0.5.

**Granular Conductivity**
specifies the solids conductivity. You can select **sylamobrien**, **gidaspow**, or **user-defined**.

**Solids Pressure**
specifies the pressure gradient term, \( \nabla p_s \) in the granular-phase momentum equation. Choose either the **lunet-al**, the **sylamobrien**, the **maahmadi**, or the **user-defined** option.
Radial Distribution
specifies a correction factor that modifies the probability of collisions between grains when the solid granular phase becomes dense. Choose either the lun-et-al, the syamlal-obrien, the ma-ahmadi, the arastapour, or a user-defined option.

Elasticity Modulus
is defined as
\[ G = \frac{\partial P}{\partial \alpha_s} \]  
with \( G \geq 0 \).
Choose either the derived or user-defined options.

Packing Limit
specifies the maximum volume fraction for the granular phase \( (\alpha_{s, \text{max}}) \). For monodispersed spheres the packing limit is about 0.63, which is the default value in ANSYS Fluent. In polydispersed cases, however, smaller spheres can fill the small gaps between larger spheres, so you may need to increase the maximum packing limit.

Transition Factor
is specified as either a constant or a user-defined function. The default value is assumed to be 0.75, which corresponds to the closest sphere packing for monosized spheres (a factor of 4/3). In other words, the transition criterion is based on the local particle volume fraction of the given discrete phase and is specified as a factor multiplied by the maximum packing limit (also a user specified value).

35.6.4. Phase Interaction Dialog Box

The Phase Interaction dialog box allows you to define the interaction between phases. It is opened from the Phases Task Page (p. 2071). The items that appear in the Phase Interaction dialog box will depend on which multiphase model you are using. See Defining the Phases for the VOF Model (p. 1296), Defining the Phases for the Mixture Model (p. 1308), and Defining the Phases for the Eulerian Model (p. 1318) for details about the items below.

Controls
Virtual Mass
includes the “virtual mass force” \( F_{vm} \) in Equation 17.273 in the Theory Guide that is present when a secondary phase accelerates relative to the primary phase. This item appears only for the Eulerian model.

Drag
displays the Drag Coefficient inputs. This tab is active only for the Eulerian and mixture models.

Drag Coefficient
specifies the drag function for each pair of phases. This section of the dialog box appears only for the Eulerian and mixture models. See Defining the Phases for the Eulerian Model (p. 1318) for information about the available options.

Drag Modification
enables modification of the selected drag models by a drag factor and expands the GUI to show the Drag Factor settings. See Drag Modification (p. 1328) for additional information on using Drag Modification.

Drag Factor
specifies the drag factor to use for modifying the specified drag model. See Drag Modification (p. 1328) for additional information on specifying the Drag Factor.

Lift
displays the Lift Coefficient inputs. This tab is active only for the Eulerian model.

Lift Coefficient
specifies the lift function for each pair of phases. This section of the dialog box appears only for the Eulerian model. See Defining the Phases for the Eulerian Model (p. 1318) for information about the available options.

Wall Lubrication
displays the Wall Lubrication inputs. This tab is active only for the Eulerian model.

Wall Lubrication
specifies the wall lubrication model for each primary-secondary phase pair. This section of the dialog box appears only for the Eulerian model. See Including the Wall Lubrication Force (p. 1329) for information about the available options.

Turbulent Dispersion
displays the Turbulent Dispersion inputs. This tab is active only for the Eulerian model.

Turbulent Dispersion
specifies the turbulent dispersion model for each primary-secondary phase pair. This section of the dialog box appears only for the Eulerian model. See Including the Turbulent Dispersion Force (p. 1332) for information about the available options.

Turbulence Interaction
displays the Turbulence Interaction inputs. This tab is active only for the Eulerian model.
**Turbulence Interaction**

specifies the turbulence interaction model for each primary-secondary phase pair. This section of the dialog box appears only for the Eulerian model. See Including Turbulence Interaction Source Terms (p. 1338) for information about the available options.

**Collisions**

displays the **Restitution Coefficient** inputs.

**Restitution Coefficient**

specifies the restitution coefficient for collisions between each pair of granular phases, and for collisions between particles of the same granular phase. It is relevant only if two or more granular phases are involved. See Defining the Phases for the Eulerian Model (p. 1318) for information about the available options.

**Slip**

displays the **Slip Velocity** inputs. This tab is active only for the mixture model.

**Slip Velocity**

specifies the slip velocity function for each secondary phase with respect to the primary phase. See Defining the Phases for the Mixture Model (p. 1308) for information about the available options.

**Heat**

displays the **Heat Transfer Coefficient** inputs. This tab is active only for the Eulerian model when the energy equation is active.

**Heat Transfer Coefficient**

specifies the heat transfer coefficient function between each pair of phases. See Including Heat Transfer Effects (p. 1340) for information about the available options.

**Mass**

displays the **Mass Transfer Function** inputs.

**Number of Mass Transfer Mechanisms**

specifies the number of mass transfer mechanisms in your simulation. See Including Mass Transfer Effects (p. 1256) for information about the available options.

**Reactions**

allows you to define multiple heterogeneous reactions and stoichiometry.

**Total Number of Heterogeneous Reactions**

specifies the total number of reactions (volumetric reactions, wall surface reactions, and particle surface reactions). See Specifying Heterogeneous Reactions (p. 1253) for information about the available options.

**Heterogeneous Stiff Chemistry Solver**

is used in inter-phase reaction mechanisms containing numerically stiff reactions. This option can improve convergence and is available for transient Eulerian multiphase simulations.

**Reaction Name**

allows you to enter a name for the reaction.

**ID**

enables you to set the reaction ID for each reaction.
Number of Reactants
allows you to specify the number of reactants that are involved in the reaction.

Number of Products
allows you to specify the number of products that are involved in the reaction.

Phase
drop-down list allows you to select the phase that is involved in the reaction.

Species
drop-down list allows you to select the species.

Stoich. Coefficient
allows you to set the stoichiometric coefficient.

Reaction Rate Function
allows you to choose rate exponents for an Arrhenius-type reaction, a user-defined function, or a population balance mechanism for the reaction rate.

Surface Tension
includes the effects of surface tension along the fluid-fluid interface.

Model
contains two surface tension models from which to choose.

Continuum Surface Force
adds the surface tension to the VOF calculation, which results in a source term in the momentum equation. This method is available only for the VOF and Eulerian models.

Continuum Surface Stress
is an alternative way to modeling surface tension in a conservative manner compared to the continuum surface force method. This method is available only for the VOF and Eulerian models.

Adhesion Options
contains options to include wall and jump adhesion.

Wall Adhesion
enables the specification of a wall adhesion angle. (The angle itself, as defined in Figure 25.26: Measuring the Contact Angle (p. 1302), will be specified in the Wall Dialog Box (p. 2160).) This item will appear only for the VOF and Eulerian models.

Jump Adhesion
enables the treatment of the contact angle specification at the porous jump boundary. (The angle itself will be specified in the Porous Jump Dialog Box (p. 2136).)

Surface Tension Coefficients
specify the surface tension coefficient, $\sigma$ in Equation 17.22 and Equation 16.72 in the Theory Guide, for each pair of phases. See Defining the Phases for the VOF Model (p. 1296) for details.

Discretization
allows you to use the diffusive and anti-diffusive discretization procedure across the distinct interfaces.
**Phase Localized Compressive Scheme**

enables the compressive discretization scheme in ANSYS Fluent, where the degree of diffusion/sharpness is controlled through the value of the slope limiters. This item will appear only for the VOF model and for the Eulerian model with **Multi-Fluid VOF Model** enabled.

**Slope Limiters**

are values equating to specific discretization schemes. For each pair of phases, you can enter a value of 0, 1, or 2, or any value between 0 and 2. Depending on the value you use, first order upwind, second order upwind, compressive, or the blended scheme will be applied. Refer to **Table 25.8: Slope Limiter Discretization Scheme** (p. 1304) to equate each value of the slope limiter with a discretization scheme. For more information, refer to **Discretizing Using the Phase Localized Compressive Scheme** (p. 1303)

### 35.7. Cell Zone Conditions Task Page

The **Cell Zones Conditions** task page allows you to set the type of a cell zone and display other dialog boxes to set the cell zone condition parameters for each zone. See **Cell Zone Conditions** (p. 215) for more information.

<table>
<thead>
<tr>
<th>Zone</th>
<th>Type</th>
<th>ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>fluid</td>
<td></td>
<td>2</td>
</tr>
</tbody>
</table>

**Controls**
Zone
contains a selectable list of available cell zones from which you can select the zone of interest. You can
check a zone type by using the mouse probe (see Controlling the Mouse Button Functions (p. 1654)) on
the displayed physical mesh. This feature is particularly useful if you are setting up a problem for the
first time, or if you have two or more cell zones of the same type and you want to determine the cell
zone IDs. To do this you must first display the mesh with the Mesh Display Dialog Box (p. 1891). Then click
the boundary zone with the right (select) mouse button. ANSYS Fluent will print the cell zone ID and
type of that boundary zone in the console window.

Phase
specifies the phase for which conditions at the selected cell Zone are being set. This item appears if the
VOF, mixture, or Eulerian multiphase model is being used. See Defining Multiphase Cell Zone and
Boundary Conditions (p. 1260) for details.

Type
contains a drop-down list of condition types for the selected cell zone. The list contains all possible types
to which the cell zone can be changed.

ID
displays the cell zone ID number of the selected cell zone. (This is for informational purposes only; you
cannot edit this number.)

Edit...
opens the Fluid Dialog Box (p. 2085) or Solid Dialog Box (p. 2092).

Copy...
opens the Copy Conditions Dialog Box (p. 2095), which allows you to copy conditions from one cell zone
to other cell zones of the same type. See Copying Cell Zone and Boundary Conditions (p. 205) for details.

Profiles...
opens the Profiles Dialog Box (p. 2098).

Parameters...
opens the Parameters Dialog Box (p. 2367).

Operating Conditions...
opens the Operating Conditions Dialog Box (p. 2095).

Display Mesh...
opens the Mesh Display Dialog Box (p. 1891).

Porous Formulation
contains options for setting the velocity in the porous medium simulation. See Defining the Porous Ve-
locity Formulation (p. 230) for details.

Superficial Velocity
enables the superficial velocity in a porous medium simulation. This is the default method.

Physical Velocity
enables the physical velocity in a porous medium simulation for a more accurate simulation. This
option is available only for a pressure-based solver. See Modeling Porous Media Based on Physical
Velocity (p. 243) for details.

For additional information, see the following sections:
35.7.1. Fluid Dialog Box
35.7.1. Fluid Dialog Box

The **Fluid** dialog box sets the conditions for a fluid cell zone. It is opened from the *Cell Zone Conditions Task Page* (p. 2083). See *Inputs for Fluid Zones* (p. 216) and *User Inputs for Porous Media* (p. 229) for details about the items below.

**Controls**

**Zone Name**
sets the name of the zone.
Material Name
sets the fluid material. The drop-down list contains the names of all materials that have been loaded into the solver. Materials are defined with the Materials Task Page (p. 2020).

Important
If you are modeling species transport or multiphase flow, the Material Name list will not appear in the Fluid dialog box. For species calculations, the mixture material for all fluid zones will be the material you specified in the Species Model Dialog Box (p. 1943). For multiphase flows, the materials are specified when you define the phases, as described in Defining the Phases for the VOF Model (p. 1296).

Frame Motion
enables the moving reference frame model for the cell zone. See Specifying the Rotation Axis (p. 218) and Defining Zone Motion (p. 218) for details.

Mesh Motion
enables the sliding mesh model for the cell zone. See Setting Up the Sliding Mesh Problem (p. 566) for details.

Porous Zone
indicates that the zone is a porous medium. Additional items will appear in the dialog box when this option is enabled. See User Inputs for Porous Media (p. 229) for details.

Laminar Zone
disables the calculation of turbulence production in the fluid zone (appears only for turbulent flow calculations using the Spalart-Allmaras model or one of the $k-\varepsilon$ or $k-\omega$ models). See Specifying a Laminar Zone (p. 217) for details.

LES Zone
allows you to model a smaller embedded LES zone within a larger URANS computational domain for turbulent flow calculations. When you turn on this option, the Embedded LES tab will be enabled to allow you to specify properties for the embedded LES zone. See Setting Up the Embedded Large Eddy Simulation (ELES) Model (p. 731) for details.

Source Terms
enables the specification of volumetric sources of mass, momentum, energy, etc. When you turn on this option, the Source Terms tab will be enabled to allow you to input the values for the desired sources. See Defining Mass, Momentum, Energy, and Other Sources (p. 251) for details.

Fixed Values
enables the fixing of the value of one or more variables in the fluid zone, rather than computing them during the calculation. See Fixing the Values of Variables (p. 247) for details.

Important
You can fix values for velocity components, temperature, and species mass fractions only if you are using the pressure-based solver.
**Participates In Radiation**
specifies whether or not the fluid zone participates in radiation. This option appears when you are using the DO model for radiation.

**Warning**
In general, disabling **Participates in Radiation** for fluid zones is not recommended, as it can produce erroneous results. There are rare cases when it is acceptable: for example, if the domain contains multiple fluid zones, disabling this option for zones where radiation is negligible may save computational time without affecting the results.

**Reaction**
enables/disables reactions in the porous zone.

**Reference Frame**
lists the parameters that define motion for a moving reference frame.

**Rotation-Axis Origin**
specifies the origin for the axis of rotation of solid zone. See Specifying the Rotation Axis (p. 223) for details. This item will appear only for 3D and 2D non-axisymmetric models.

**Rotation-Axis Direction**
specifies the direction vector for the solid zone's axis of rotation. See Specifying the Rotation Axis (p. 223) for details. This item will appear only for 3D models.

**Rotational Velocity**
contains an input field for the rotational **Speed** of the zone.

**Translational Velocity**
contains inputs for the **X**, **Y**, and **Z** velocities of the zone.

**Relative Specification**
indicates whether the velocities are absolute velocities (**absolute**) or velocities relative to the motion of each cell zone (**Relative to Cell Zone**). This selection is necessary only if your problem involves moving reference frames or sliding meshes. If there is no zone motion, both options are equivalent.

**UDF**
allows you to hook the DEFINE_ZONE_MOTION UDF.

**Copy to Mesh Motion**
allows you to switch between the MRF and moving mesh models. The variables used for the origin, axis, and velocity components, as well as for the UDF DEFINE_ZONE_MOTION will be copied from one model to the other.

**Mesh Motion**
lists the parameters that define motion for a moving reference frame.

**Rotation-Axis Origin**
specifies the origin for the axis of rotation of solid zone. See Specifying the Rotation Axis (p. 223) for details. This item will appear only for 3D and 2D non-axisymmetric models.

**Rotation-Axis Direction**
specifies the direction vector for the solid zone's axis of rotation. See Specifying the Rotation Axis (p. 223) for details. This item will appear only for 3D models.
Rotational Velocity
contains an input field for the rotational Speed of the zone.

Translational Velocity
contains inputs for the X, Y, and Z velocities of the zone.

Relative Specification
indicates whether the velocities are absolute velocities (absolute) or velocities relative to the motion of each cell zone (Relative to Cell Zone). This selection is necessary only if your problem involves moving reference frames or sliding meshes. If there is no zone motion, both options are equivalent.

UDF
allows you to hook the DEFINE_ZONE_MOTION UDF.

Copy to Frame Motion
allows you to switch between the MRF and moving mesh models. The variables used for the origin, axis, and velocity components, as well as for the UDF DEFINE_ZONE_MOTION will be copied from one model to the other.

Porous Zone
lists the parameters associated with the porous zone.

Conical
enables the specification of a conical (or cylindrical) porous medium. This item will appear only when the Porous Zone option is enabled for a 3D case.

Cone Half Angle
specifies the angle between the cone’s axis and its surface (see Figure 6.13: Cone Half Angle (p. 233)). Set this to 0 to define the porous region using a cylindrical coordinate system. This item will appear only when the Porous Zone and Conical options are enabled.

Snap to Zone
aligns the plane (or line, in 2D) tool with the zone selected in the drop-down list. The tool is centered at the centroid of the zone, with the tool’s axis normal to the zone. If this axis is not the desired cone axis, reposition the tool (as described in Using the Plane Tool (p. 1591)). When you are satisfied with the axis, click the Update From Plane Tool (or Update From Line Tool) button to update the Cone Axis Vector fields.

This item will appear only when the Porous Zone and Conical options are enabled.

Update From Plane Tool
(Update From Line Tool in 2D) updates the Direction-1 Vector and (in 3D) the Direction-2 Vector from the plane tool orientation. If the Conical option is enabled, this button will update the Cone Axis Vector and the Point on Cone Axis. See Defining the Viscous and Inertial Resistance Coefficients (p. 231) for details. This item will appear only when the Porous Zone option is enabled.

Direction-1 Vector, Direction-2 Vector
indicate the directions for which the resistance coefficients are defined. See Defining the Viscous and Inertial Resistance Coefficients (p. 231) for details. These items will appear only when the Porous Zone option is enabled, but the Conical option is not. (In 2D, only Direction-1 Vector will appear.)

Cone Axis Vector
specifies the X,Y,Z vector for the cone’s axis.

This item will appear only when the Porous Zone and Conical options are enabled.
Point on Cone Axis
specifies a point on the cone's axis. This point will be used by ANSYS Fluent to transform the resistances to the Cartesian coordinate system.

This item will appear only when the Porous Zone and Conical options are enabled.

Relative Velocity Resistance Formulation
allows ANSYS Fluent to either apply the relative reference frame or the absolute reference frame. This allows for the correct prediction of the source terms.

Viscous Resistance, Inertial Resistance
contain inputs for the viscous resistance coefficient $1/\alpha$ and the inertial resistance coefficient $C^2$ in each direction. See Defining the Viscous and Inertial Resistance Coefficients (p. 231) for details. These items will appear only when the Porous Zone option is enabled.

Alternative Formulation
provides better stability to the calculation when your porous medium is anisotropic.

If you have enabled the Conical option, Direction-1 is the cone axis direction, Direction-2 is the normal to the cone surface (radial ($r$) direction for a cylinder), and Direction-3 is the circumferential ($\theta$) direction.

Power Law Model
contains inputs for the $C_0$ and $C_1$ coefficients in the power law model for porous media. See Using the Power-Law Model (p. 238) for details.

Fluid Porosity
contains an additional input for the porous medium. See User Inputs for Porous Media (p. 229) for details.

Porosity
sets the volume fraction of fluid within the porous region.

Heat Transfer Settings
contains heat transfer settings for the porous medium. See Specifying the Heat Transfer Settings (p. 239) for details.

Thermal Model
specifies whether or not thermal equilibrium is assumed between the medium and the fluid flow.

Equilibrium
specifies that the medium and the fluid flow are in thermal equilibrium in the porous medium.

Non-Equilibrium
specifies that the medium and the fluid flow are not in thermal equilibrium in the porous medium, so that a dual cell approach is enabled.

Solid Material Name
specifies the solid material in the porous region. This drop-down menu is only available when Equilibrium is selected from the Thermal Model list.
**Solid Zone**
displays the name of the solid cell zone that is coupled with the porous fluid zone through heat transfer. This text box is only displayed when **Non-Equilibrium** is selected from the **Thermal Model** list.

**Interfacial Area Density**
 specifies \( A_{fs} \) (as described in Non-Equilibrium Thermal Model Equations (p. 227)) for the porous region. This text-entry box is only available when **Non-Equilibrium** is selected from the **Thermal Model** list.

**Heat Transfer Coefficient**
 specifies \( h_{fs} \) (as described in Non-Equilibrium Thermal Model Equations (p. 227)) for the porous region. This text-entry box is only available when **Non-Equilibrium** is selected from the **Thermal Model** list.

**Anisotropic Species Diffusion**
 allows you to model anisotropic species diffusion in porous media. When this option is selected, you can specify the **Matrix Components** for the anisotropic diffusion matrix in the porous zone. This option is available only with the species transport models.

**Reaction**
lists the parameters for reactions in the porous zone.

**Reaction Mechanism**
 allows you to specify a defined group, or mechanism, of available reactions. See Defining Zone-Based Reaction Mechanisms (p. 904) for details about defining reaction mechanisms.

**Surface-to-Volume Ratio**
specifies the surface area of the pore walls per unit volume \( \frac{A}{V} \), and can be thought of as a measure of catalyst loading. With this value, ANSYS Fluent can calculate the total surface area on which the reaction takes place in each cell by multiplying \( \frac{A}{V} \) by the volume of the cell.

**Source Terms**
defines a source of heat, mass, momentum, turbulence, species, or other scalar quantity within the fluid zone.

**Fixed Values**
lists the fixed parameters of the fluid zone.

**Local Coordinate System for Fixed Velocities**
enables the specification of fixed cylindrical velocity components instead of Cartesian components. The local coordinate system is defined by the **Rotation-Axis Origin** and **Rotation-Axis Direction**.

This item is available only in 3D, and only when the **Fixed Values** option is on.

**Multiphase**
allows you to set parameters that are specific to the multiphase models.

**Compressive Scheme Slope Limiter**
ranges from 0 to 2. For example, a **Compressive Scheme Slope Limiter** of 0 corresponds to first order upwind behavior, a value of 1 corresponds to second order upwind, and a value of 2 applies...
the compressive scheme. The **Multiphase** tab is available only if **Zonal Discretization** is enabled in the **Multiphase Model Dialog Box** (p. 1899).

**Numeric Beach Treatment**
is available when **Open Channel Flow** and/or **Open Channel Wave BC** is enabled in the **Multiphase Model** dialog box (see **Numerical Beach Treatment for Open Channels** (p. 1292) for more detail).

**Numerical Beach**
when enabled expands the dialog box where you can specify the numerical beach parameters.

**Beach Group ID**
represents the cell zones sharing the damping length containing the same input parameters.

**Damping Type**
allows you to choose between **One Dimensional** and **Two Dimensional** damping.

**One Dimensional**
is the damping treatment in the flow direction.

**Two Dimensional**
is the damping treatment in the flow and gravity direction.

**Compute From Inlet Boundary**
is set to **none** by default. If there are available open channel boundaries (velocity-inlet, pressure-inlet, and mass-flow-inlet), boundary names are added to the drop-down list. If you select a boundary from the list, the **Level Inputs**, **Damping Length Inputs in Flow Direction**, and **Damping Resistance** values will be updated in the interface. You have the option to overwrite the updated inputs with values that are more applicable to your simulation.

**Level Inputs**
is only available for the **Two Dimensional** damping type.

**Free Surface Level**
is the same definition as for open channel flow, see **Modeling Open Channel Flows** (p. 1275).

**Bottom Level**
is the same definition as for open channel flow, see **Modeling Open Channel Flows** (p. 1275), and is valid only for shallow waves. The bottom level is used for calculating the liquid height.

**Flow Direction**
is the X, Y, and Z (for 3D) components.

**Damping Length Inputs in Flow Direction**
are required to calculate the start and end points of the damping length in the flow direction.

**Damping Length Specification**
is only available if **Open Channel Wave BC** is enabled in the **Multiphase Model** dialog box. There are two options you can choose from **End Point and Wave Lengths** or **End and Start Points**.

**End Point**
is the end point of the damping zone.

**Start Point**
is the starting point in the flow direction.
**Wave Length**

is updated automatically if the boundary is selected from the *Compute From Inlet Boundary* drop-down list.

**Number Of Wave Lengths**

is set to 2 by default for the calculation of the damping length.

**Relative Velocity Resistance Formulation**

calculates the source term using relative velocities in the numerical beach zone when using moving/deforming meshes or moving reference frames.

**Linear Damping Resistance**

is the resistance per unit time.

**Quadratic Damping Resistance**

is the resistance per unit length.

### 35.7.2. Solid Dialog Box

The **Solid** dialog box sets the boundary conditions for a solid cell zone. It is opened from the *Cell Zone Conditions Task Page* (p. 2083). See *Inputs for Solid Zones* (p. 221) for details about the items below.

![Solid Dialog Box](image)

**Controls**
Zone Name  
sets the name of the zone.

Material Name  
selects the material type of the solid. Materials are defined with the Materials Task Page (p. 2020).

Frame Motion  
enables the moving reference frame model for the cell zone. See Specifying the Rotation Axis (p. 218) and Defining Zone Motion (p. 218) for details.

Mesh Motion  
enables the sliding mesh model for the cell zone. See Setting Up the Sliding Mesh Problem (p. 566) for details.

Source Terms  
enables the specification of a volumetric source of energy. When you turn on this option, the Source Term tab will allow you to input the value for the energy source. See Defining Mass, Momentum, Energy, and Other Sources (p. 251) for details.

Fixed Values  
enables the fixing of the value of temperature in the solid zone, rather than computing it during the calculation. See Fixing the Values of Variables (p. 247) for details.

Important  
You can fix the value of temperature only if you are using the pressure-based solver.

Participates In Radiation  
specifies whether or not the solid zone participates in radiation. This option appears when you are using the DO model for radiation.

Reference Frame  
lists the parameters that define motion for a moving reference frame.

Rotation-Axis Origin  
specifies the origin for the axis of rotation of solid zone. See Specifying the Rotation Axis (p. 223) for details. This item will appear only for 3D and 2D non-axisymmetric models.

Rotation-Axis Direction  
specifies the direction vector for the solid zone’s axis of rotation. See Specifying the Rotation Axis (p. 223) for details. This item will appear only for 3D models.

Rotational Velocity  
contains an input field for the rotational Speed of the zone.

Translational Velocity  
contains inputs for the X, Y, and Z velocities of the zone.

Relative Specification  
indicates whether the velocities are absolute velocities (absolute) or velocities relative to the motion of each cell zone (Relative to Cell Zone). This selection is necessary only if your problem involves moving reference frames or sliding meshes. If there is no zone motion, both options are equivalent.
UDF
allows you to hook the DEFINE_ZONE_MOTION UDF.

Copy to Mesh Motion
allows you to switch between the MRF and moving mesh models. The variables used for the origin, axis, and velocity components, as well as for the UDF DEFINE_ZONE_MOTION will be copied from one model to the other.

Mesh Motion
lists the parameters that define motion for a moving reference frame.

Rotation-Axis Origin
specifies the origin for the axis of rotation of solid zone. See Specifying the Rotation Axis (p. 223) for details. This item will appear only for 3D and 2D non-axisymmetric models.

Rotation-Axis Direction
specifies the direction vector for the solid zone’s axis of rotation. See Specifying the Rotation Axis (p. 223) for details. This item will appear only for 3D models.

Rotational Velocity
contains an input field for the rotational Speed of the zone.

Translational Velocity
contains inputs for the X, Y, and Z velocities of the zone.

Relative Specification
indicates whether the velocities are absolute velocities (absolute) or velocities relative to the motion of each cell zone (Relative to Cell Zone). This selection is necessary only if your problem involves moving reference frames or sliding meshes. If there is no zone motion, both options are equivalent.

UDF
allows you to hook the DEFINE_ZONE_MOTION UDF.

Copy to Frame Motion
allows you to switch between the MRF and moving mesh models. The variables used for the origin, axis, and velocity components, as well as for the UDF DEFINE_ZONE_MOTION will be copied from one model to the other.

Source Term
lists the parameters for volumetric source of energy.

Energy
displays the total number of energy sources used.

User Scalar n
displays the total number of scalars used.

Fixed Values
lists the parameters that can be declared as fixed during the calculation.

Temperature
specifies the fixed value for temperature.

User Scalar n
specifies the fixed value for user scalar.
35.7.3. Copy Conditions Dialog Box

The **Copy Conditions** dialog box allows you to copy cell zone and/or boundary conditions from one zone/boundary to other zones/boundaries of the same type. It is opened either from the Cell Zone Conditions Task Page (p. 2083) or from the Boundary Conditions Task Page (p. 2102). See Copying Cell Zone and Boundary Conditions (p. 205) for details.

![Copy Conditions dialog box](image)

**Controls**

**From Zone**
- specifies the zone that has the conditions you want to copy.

**To Zones**
- specifies the zone or zones to which you want to copy the conditions.

**Phase**
- specifies the phase for which cell zone conditions or boundary conditions are being copied. This item appears if the VOF, mixture, or Eulerian multiphase model is being used. See Steps for Copying Cell Zone and Boundary Conditions (p. 1273) for details.

**Copy**
- copies the cell zone conditions or boundary conditions, setting all of the conditions for the zones selected in the **To Zones** list to be the same as the conditions for the zone selected in the **From Zone** list.

35.7.4. Operating Conditions Dialog Box

The **Operating Conditions** dialog box allows you to set parameters related to operating conditions in your model.
Controls

Pressure contains items related to the modeling of pressure.

**Floating Operating Pressure**

specifies the use of a floating operating pressure. See Floating Operating Pressure (p. 529) for details. This option appears only for time-dependent compressible flows.

**Operating Pressure**

sets the operating pressure for the problem. For all flows, ANSYS Fluent uses gauge pressure internally. Any time an absolute pressure is needed, it is generated by adding the operating pressure to the relative pressure. See Operating Pressure (p. 466) for a detailed description of operating pressure and how to set it.

**Reference Pressure Location**

sets the location of the cell whose pressure value is used to adjust the gauge pressure field for incompressible flows that do not involve any pressure boundaries. See Reference Pressure Location (p. 468) for details.

**Real Gas Phase**

allows you to specify the operating conditions in the subcritical regime of your model. Note that if the operating conditions in your model are entirely in the supercritical regime, this setting will have no effect.

---

**Note**

This option appears only when a Cubic Equation of State Real Gas model is chosen.
**Vapor**

is the default option, and therefore assumes that the real gas phase is vapor.

**Liquid**

assumes that the real gas phase is liquid.

**Gravity**

contains inputs for gravitational acceleration, the Boussinesq model, and variable density.

**Gravity**

enables the specification of gravity.

**Gravitational Acceleration**

sets the $x$, $y$, and $z$ components of the gravitational acceleration vector. (The $z$ component is available only in 3D solvers.) See *Natural Convection and Buoyancy-Driven Flows (p. 765)* for details about buoyancy-driven flows. This option appears only when **Gravity** is enabled.

**Boussinesq Parameters**

contains inputs related to the Boussinesq model. This option appears only if **Energy** (in the Energy Dialog Box (p. 1903)) and **Gravity** are enabled. See *The Boussinesq Model (p. 766)* for more information on the Boussinesq model.

**Operating Temperature**

sets the operating temperature ($T_0$ in Equation 13.2 (p. 766)) for use with the Boussinesq approximation.

**Variable-Density Parameters**

contains inputs related to the modeling of variable density. This option appears only when **Gravity** is enabled.

**Specified Operating Density**

enables the specification of operating density. See *Operating Density (p. 768)* for details.

**Operating Density**

sets the operating density ($\rho_0$ in Equation 13.3 (p. 768)). This parameter can be set only when **Specified Operating Density** is enabled.

### 35.7.5. Select Input Parameter Dialog Box

The **Select Input Parameter** dialog box allows you to choose from a listing of existing input parameters as well as to create and define new input parameters. For more information about parameters, see *Defining and Viewing Parameters (p. 206)* in the User's Guide, and see *Working With Input and Output Parameters in Workbench* in the ANSYS Fluent in Workbench User's Guide.
**Controls**

**Parameters**
contains a list of existing compatible input parameters

**Current Value**
displays the value of the currently selected parameter.

**Used In**
lists any variables that are already associated with the currently selected parameter.

**Use Constant**
allows you to change the associated parameter to a constant (that is, real) value.

**New Parameter**
opens the Input Parameter Properties Dialog Box (p. 2372), in which you can assign names and values to an input parameter.

### 35.7.6. Profiles Dialog Box

The Profiles dialog box allows you to define new profiles by reading cell zone and boundary profile files. You can also examine the existing profile definitions and delete unused profiles. See Profiles (p. 377) for details about cell zone and boundary profiles.
Controls

Profile
contains a selectable list of available profiles. When a profile is selected its available fields are displayed under Fields.

Fields
displays the fields available in the selected profile. After the profile file has been read, these fields will also appear in any boundary condition dialog box (for example, the Velocity Inlet dialog box) that allows profile specification of a variable. To the right of (or below) the variable in the boundary conditions dialog box, there will be a drop-down list that contains a constant and the fields from available profile files. To use a particular profile field, just select it from the list.

Interpolation Method
allows you to select the interpolation method for the profile selected from the Profile list. This selection is only available for point profiles, and will only take effect when the Apply button is clicked. The choices include the following:

Constant
specifies that ANSYS Fluent should use zeroth-order interpolation to assign the point profile values to the nearest cell faces at the boundary. This is the default selection.

Inverse Distance
specifies that ANSYS Fluent should assign a value to each cell face at the boundary based on weighted contributions from the values in the point profile file. The weighting factor is inversely proportional to the distance between the profile point and the cell face center.

Least Squares
specifies that ANSYS Fluent should assign values to the cell faces at the boundary through a first-order interpolation method that tries to minimizes the sum of the squares of the offsets (residuals) between the profile data points and the cell face centers.

Delete
deletes the selected profile from memory.

Orient...
opens the Orient Profile Dialog Box (p. 2100), in which you can reorient and scale the profile. This item appears only in 3D.
Read...  opens the Select File Dialog Box (p. 15) so that you can read a boundary profile file. If a profile in the file has the same name as an existing profile, the old profile will be overwritten.

Write...  opens the Write Profile Dialog Box (p. 2101), in which you can save profile data.

Apply  sets the selection made in the Interpolation Method list for point profiles in preparation for interpolation. The profile is not actually interpolated until a profile field is selected in a boundary condition dialog box (for example, the Velocity Inlet dialog box) and the solution is initialized.

35.7.7. Orient Profile Dialog Box

The Orient Profile dialog box allows you to reorient a profile so that you can apply it to a particular boundary. See Reorienting Profiles (p. 383) for details.

Controls

Current profile  shows the name of the currently selected profile in the Profiles Dialog Box (p. 2098). This is the profile on which the new profile will be based.

New Profile  sets the name of the new cell zone or boundary profile.

New Field Definitions  contains inputs and controls for the definition of the vector and scalar fields in the new profile.

New Fields  sets the number of data fields in the new profile.
**New Field Names**
contains inputs for the names of the data fields in the new profile. For a vector field, all 3 inputs in each row will be active; for a scalar field, only the first will be active.

**Compute From...**
contains drop-down lists with the names of the fields in the **Current profile**. In these lists, select the fields from which the **New Field Names** will be computed.

**Treat as Scalar Quantity**
indicates (if on) that the adjacent field is a scalar quantity. If this option is off, the field is a vector quantity.

**Orient To...**
contains inputs for the definition of the local coordinate system for the new profile. This coordinate system will determine the orientation of the profile.

**Direction Vector**
is the vector that translates a cell zone or boundary profile to the new position, and is defined between the centers of the profile fields.

**Rotation Matrix [RM]**
\[ \begin{bmatrix} \gamma & \beta & \alpha \end{bmatrix} \]
specifies the rotational matrix \( RM \) which is based on Euler angles \( (\gamma, \beta, \alpha) \) that define an orthogonal system \( x' y' z' \) as the result of the three successive rotations from the original system \( xyz \). See Reorienting Profiles (p. 383) for more information.

**Create**
creates a new profile using the information specified in the dialog box.

### 35.7.8. Write Profile Dialog Box

The **Write Profile** dialog box allows you to create a profile file from the conditions on a specified cell zone or boundary/surface. See Writing Profile Files (p. 55) for details on writing profile files.
Controls

Options
contains options for writing profiles.

Define New Profiles
enables the creation of a profile file from the conditions on a specified boundary or surface.

Write Currently Defined Profiles
enables the creation of a profile file containing all profiles that are currently defined.

Surfaces
contains a list from which you can select the surface(s) from which you want to extract data.

Values
contains a list from which you can select the variable(s) for which you want to create profiles.

Write...
opens The Select File Dialog Box (p. 15), in which you can specify a filename for the profile file.

35.8. Boundary Conditions Task Page

The Boundary Conditions task page allows you to set the type of a boundary and display other dialog boxes to set the boundary condition parameters for each boundary.
Controls

Zone

contains a selectable list of boundary zones from which you can select the zone of interest. You can check a zone type by using the mouse probe (see Controlling the Mouse Button Functions (p. 1654)) on the displayed physical mesh. This feature is particularly handy if you are setting up a problem for the first time, or if you have two or more boundary zones of the same type and you want to determine the zone IDs. To do this you must first display the mesh with the Mesh Display Dialog Box (p. 1891). Then click the boundary zone with the right (select) mouse button. ANSYS Fluent will print the zone ID and type of that boundary zone in the console window.

Phase

specifies the phase for which conditions at the selected boundary Zone are being set. This item appears if the VOF, mixture, or Eulerian multiphase model is being used. See Defining Multiphase Cell Zone and Boundary Conditions (p. 1260) for details.
Type
contains a drop-down list of boundary condition types for the selected zone. The list contains all possible types to which the zone can be changed.

Important
Note that you cannot use this method to change zone types to or from the periodic type, since additional restrictions exist for this boundary type. Creating Conformal Periodic Zones (p. 184) explains how to create and uncouple periodic zones.

ID
displays the zone ID number of the selected zone. (This is for informational purposes only; you cannot edit this number.)

Edit...
opens the appropriate dialog box for setting the boundary conditions for that particular boundary type.

Copy...
opens the Copy Conditions Dialog Box (p. 2095), which allows you to copy boundary conditions from one zone to other zones of the same type. See Copying Cell Zone and Boundary Conditions (p. 205) for details.

Profiles...
opens the Profiles Dialog Box (p. 2098).

Parameters...
opens the Parameters Dialog Box (p. 2367).

Operating Conditions...
opens the Operating Conditions Dialog Box (p. 2095).

Display Mesh...
opens the Mesh Display Dialog Box (p. 1891).

Periodic Conditions...
opens the Periodic Conditions Dialog Box (p. 2170).

Highlight Zone
when enabled highlights the boundary zone (selected in the task page) in the graphics window.

For additional information, see the following sections:
35.8.1. Axis Dialog Box
35.8.2. Degassing Dialog Box
35.8.3. Exhaust Fan Dialog Box
35.8.4. Fan Dialog Box
35.8.5. Inlet Vent Dialog Box
35.8.6. Intake Fan Dialog Box
35.8.7. Interface Dialog Box
35.8.8. Interior Dialog Box
35.8.9. Mass-Flow Inlet Dialog Box
35.8.10. Outflow Dialog Box
35.8.11. Outlet Vent Dialog Box
35.8.12. Periodic Dialog Box
35.8.13. Porous Jump Dialog Box
35.8.1. Axis Dialog Box

The **Axis** dialog box can be used to modify the name of an axis zone; there are no conditions to be set. It is opened from the **Boundary Conditions Task Page** (p. 2102). See **Axis Boundary Conditions** (p. 335) for information about axis boundaries.

**Controls**

**Zone Name**
sets the name of the zone.

**Phase**
displays the name of the phase. This item appears if the VOF, mixture, or Eulerian multiphase model is being used.

35.8.2. Degassing Dialog Box

The **Degassing** dialog box can be used to modify the name of a degassing zone; there are no conditions to be set. It is opened from the **Boundary Conditions Task Page** (p. 2102). See **Degassing Boundary Conditions** (p. 308) for information about axis boundaries.

**Controls**

**Zone Name**
sets the name of the zone.
Phase displays the name of the phase.

**35.8.3. Exhaust Fan Dialog Box**

The **Exhaust Fan** dialog box sets the boundary conditions for an exhaust fan zone. It is opened from the **Boundary Conditions Task Page** (p. 2102). See **Inputs at Exhaust Fan Boundaries** (p. 307) for details about defining the items below.

![Exhaust Fan Dialog Box](image)

### Controls

**Zone Name**
sets the name of the zone.

**Phase**
displays the name of the phase. It appears only for multiphase flows.

**Momentum**
contains the momentum parameters.

**Gauge Pressure**
sets the gauge pressure at the outlet boundary.

**Backflow Direction Specification Method**
sets the direction of the inflow stream should the flow reverse direction. You can choose **Direction Vector**, **Normal to Boundary**, or **From Neighboring Cell**.
Coordinate System
contains a drop-down list for selecting the coordinate system. You can choose Cartesian, Cylindrical, or Local Cylindrical. This option is available only for Direction Vector.

X, Y, Z-Component of Flow Direction
allows you to specify the velocity components in x, y, and z directions respectively. This option is available for cartesian coordinate system.

Radial Equilibrium Pressure Distribution
enables the radial equilibrium pressure distribution. See Defining Static Pressure (p. 290) for details.

This item appears only for 3D and axisymmetric swirl solvers.

Pressure Jump
specifies the rise in pressure across the fan. See Specifying the Pressure Jump (p. 307) for details.

Target Mass Flow Rate
allows you to set mass flow rate as a boundary condition at the outlet.

Turbulence
display the turbulence parameters.

Specification Method
specifies which method will be used to input the turbulence parameters. You can choose K and Epsilon (k-ε models and RSM only), K and Omega (k-ω models only), Intensity and Length Scale, Intensity and Viscosity Ratio, Intensity and Hydraulic Diameter, or Turbulent Viscosity Ratio (Spalart-Allmaras model only). See Determining Turbulence Parameters (p. 257) for information about the inputs for each of these methods. (This item will appear only for turbulent flow calculations.)

Backflow Turbulent Kinetic Energy, Backflow Turbulent Dissipation Rate
set values for the turbulence kinetic energy \( k \) and its dissipation rate \( \varepsilon \). These items will appear if you choose K and Epsilon as the Specification Method.

Backflow Turbulent Kinetic Energy, Backflow Specification Dissipation Rate
set values for the turbulence kinetic energy \( k \) and its specific dissipation rate \( \omega \). These items will appear if you choose K and Omega as the Specification Method.

Backflow Turbulent Intensity, Backflow Turbulent Length Scale
set values for turbulence intensity \( I \) and turbulence length scale \( \ell \). These items will appear if you choose Intensity and Length Scale as the Specification Method.

Backflow Turbulent Intensity, Backflow Turbulent Viscosity Ratio
set values for turbulence intensity \( I \) and turbulent viscosity ratio \( \mu_t / \mu \). These items will appear if you choose Intensity and Viscosity Ratio as the Specification Method.

Backflow Turbulent Intensity, Backflow Hydraulic Diameter
set values for turbulence intensity \( I \) and hydraulic diameter \( L \). These items will appear if you choose Intensity and Hydraulic Diameter as the Specification Method.

Backflow Turbulent Viscosity Ratio
sets the value of the backflow turbulent viscosity ratio \( \mu_t / \mu \). This item will appear if you choose Turbulent Viscosity Ratio as the Specification Method.
**Reynolds-Stress Specification Method**

specifies which method will be used to determine the backflow Reynolds stress boundary conditions when the Reynolds stress turbulence model is used. You can choose either **K or Turbulence Intensity** or **Reynolds-Stress Components**. If you choose the former, ANSYS Fluent will compute the Reynolds stresses for you. If you choose the latter, you will explicitly specify the Reynolds stresses yourself. See **Reynolds Stress Model (p. 742)** for details. (This item will appear only for RSM turbulent flow calculations.)

**Backflow UU, VV, WW, UV, VW, UW Reynolds Stresses**

specify the backflow Reynolds stress components when **Reynolds-Stress Components** is chosen as the **Reynolds-Stress Specification Method**.

**Thermal**

contains the thermal parameters. This parameter is available only when the energy equation is turned on.

**Backflow Total Temperature**

sets the total temperature of the inflow stream should the flow reverse direction.

**Radiation**

contains the boundary conditions for the radiation model at the exhaust fan.

**External Black Body Temperature Method, Internal Emissivity**

set the radiation boundary conditions when you are using the P-1 model, the DTRM, the discrete ordinates model, or the S2S model for radiation heat transfer. See **Defining Boundary Conditions for Radiation (p. 798)** for details.

**Participates in Solar Ray Tracing**

specifies whether or not the fan participates in solar ray tracing.

**Solar Transmissivity Factor**

specifies a multiplier (ranging from 0 to 1) that is applied to the solar irradiation entering the domain through the fan.

**Participates in View Factor Calculation**

specifies whether or not the fan participates in the view factor calculation as part of the S2S radiation model. This parameter is available only if you select the **Surface to Surface** radiation model.

**Species**

contains the species parameters.

**Specify Species in Mole Fractions**

allows you to specify the species in mole fractions rather than mass fractions.

**Mean Mixture Fraction, Mixture Fraction Variance**

set inlet values for the PDF mixture fraction and its variance. (These items will appear only if you are using the non-premixed or partially premixed combustion model.)

**Secondary Mean Mixture Fraction, Secondary Mixture Fraction Variance**

set inlet values for the secondary mixture fraction and its variance. (These items will appear only if you are using the non-premixed or partially premixed combustion model with two mixture fractions.)
Species Mass Fractions
contains inputs for the mass fractions of defined species. See Defining Cell Zone and Boundary Conditions for Species (p. 910) for details about these inputs. These items will appear only if you are modeling non-reacting multi-species flow or you are using the finite-rate reaction formulation.

Backflow Progress Variable
sets the value of the progress variable for premixed turbulent combustion. See Setting Boundary Conditions for the Progress Variable (p. 1008) for details.

This item will appear only if the premixed or partially premixed combustion model is used.

DPM
contains the discrete phase parameters. This tab is available only if you have defined at least one injection.

Discrete Phase BC Type
sets the way that the discrete phase behaves with respect to the boundary. This item appears when one or more injections have been defined.

reflect
rebounds the particle off the boundary with a change in its momentum as defined by the coefficient of restitution. (See Figure 24.23: “Reflect” Boundary Condition for the Discrete Phase (p. 1190))

trap
terminates the trajectory calculations and records the fate of the particle as “trapped”. In the case of evaporating droplets, their entire mass instantaneously passes into the vapor phase and enters the cell adjacent to the boundary. See Figure 24.24: “Trap” Boundary Condition for the Discrete Phase (p. 1191).

escape
reports the particle as having “escaped” when it encounters the boundary. Trajectory calculations are terminated. See Figure 24.25: “Escape” Boundary Condition for the Discrete Phase (p. 1191).

wall-jet
indicates that the direction and velocity of the droplet particles are given by the resulting momentum flux, which is a function of the impingement angle. See Figure 16.2: “Wall Jet” Boundary Condition for the Discrete Phase in the Theory Guide.

wall-film
consists of four regimes: stick, rebound, spread, and splash, which are based on the impact energy and wall temperature. Detailed information on the wall-film model can be found in Wall-Film Model Theory in the Theory Guide. The Number Of Splashed Drops must be specified.

user-defined
specifies a user-defined function to define the discrete phase boundary condition type.

Discrete Phase BC Function
sets the user-defined function from the drop-down list.

Multiphase
contains the multiphase parameters.

Backflow Granular Temperature
specifies temperature for the solids phase and is proportional to the kinetic energy of the random motion of the particles.
Backflow Volume Fraction
specifies the volume fraction of the secondary phase selected in the Boundary Conditions Task Page (p. 2102). This section of the dialog box will appear when one of the multiphase models is being used. See Defining Multiphase Cell Zone and Boundary Conditions (p. 1260) for details.

UDS
contains the UDS parameters.

User-Defined Scalar Boundary Condition
appears only if user defines scalars are specified.

User Scalar-n
specifies whether the scalar is a specified flux or a specified value.

User-Defined Scalar Boundary Value
appears only if user defines scalars are specified.

User Scalar-n
specifies the value of the scalar.

35.8.4. Fan Dialog Box

The Fan dialog box sets the boundary conditions for a fan zone. It is opened from the Boundary Conditions Task Page (p. 2102). See User Inputs for Fans (p. 337) for details about the items below.

Controls
Zone Name
sets the name of the zone.

Pressure-Jump Specification
contains inputs that define the pressure jump across the fan.
**Reverse Fan Direction**

sets the fan flow direction relative to the zone direction. If **Zone Average Direction** is pointing in the direction you want the fan to blow, do *not* select **Reverse Flow**; if it is pointing in the opposite direction, select **Reverse Flow**.

**Zone Average Direction**

displays the (face-averaged) direction vector for the zone as an aid in determining whether or not you want to select **Reverse Flow**.

**Profile Specification of Pressure-Jump**

enables the use of a boundary profile or user-defined function for the pressure jump specification. See **Profiles (p. 377)** or the **UDF Manual** for details. When this option is enabled, **Pressure Jump Profile** will appear in the dialog box and the next four items below it will not.

**Pressure Jump Profile**

contains a drop-down list from which you can select a boundary profile or a user-defined function for the pressure jump definition. This item will appear if you enable **Profile Specification of Pressure-Jump**.

**Pressure-Jump**

specifies the pressure-jump as a constant value or as a polynomial, piecewise-linear, or piecewise-polynomial function of velocity. See **Defining the Pressure Jump (p. 338)** for details.

**Limit Polynomial Velocity Range**

limits the minimum and maximum velocity magnitudes used to calculate the pressure jump when it is defined as a function of velocity.

**Min Velocity Magnitude, Max Velocity Magnitude**

specify the minimum and maximum values to which the velocity magnitude is limited (when the **Limit Polynomial Velocity Range** option is enabled).

**Calculate Pressure-Jump from Average Conditions**

enables the option to use the mass-averaged velocity normal to the fan to determine a single pressure-jump value for all faces in the fan zone.

**Discrete Phase BC Type**

sets the way that the discrete phase behaves with respect to the boundary. This item appears when one or more injections have been defined.

**interior**

allows the particles to pass through the boundary.

**reflect**

rebounds the particle off the boundary with a change in its momentum as defined by the coefficient of restitution. (See **Figure 24.23: “Reflect” Boundary Condition for the Discrete Phase (p. 1190)**)

**trap**

terminates the trajectory calculations and records the fate of the particle as “trapped”. In the case of evaporating droplets, their entire mass instantaneously passes into the vapor phase and enters the cell adjacent to the boundary. See **Figure 24.24: “Trap” Boundary Condition for the Discrete Phase (p. 1191)**.
escape  
reports the particle as having “escaped” when it encounters the boundary. Trajectory calculations are terminated. See Figure 24.25: “Escape” Boundary Condition for the Discrete Phase (p. 1191).

wall-jet  
indicates that the direction and velocity of the droplet particles are given by the resulting momentum flux, which is a function of the impingement angle. See Figure 16.2: “Wall Jet” Boundary Condition for the Discrete Phase in the Theory Guide.

wall-film  
consists of four regimes: stick, rebound, spread, and splash, which are based on the impact energy and wall temperature. Detailed information on the wall-film model can be found in Wall-Film Model Theory in the Theory Guide. The Number Of Splashed Drops must be specified.

user-defined  
specifies a user-defined function to define the discrete phase boundary condition type.

Discrete Phase BC Function  
sets the user-defined function from the drop-down list.

Swirl-Velocity Specification  
contains inputs for the specification of fan swirl velocity. This section of the dialog box appears only for 3D models.

Swirl-Velocity Specification  
enables the specification of a swirl velocity for the fan.

Fan Axis  
sets the direction vector for the fan’s axis of rotation.

Fan Origin  
sets the origin in the global coordinate system through which the fan rotation axis passes.

Fan Hub Radius  
set the radius of the hub. The default is 1e-6 to avoid division by zero in the polynomial.

Profile Specification of Tangential Velocity  
enables the use of a boundary profile or user-defined function for the tangential velocity specification. See Profiles (p. 377) or the UDF Manual for details. When this option is enabled, Tangential Velocity Profile will appear in the dialog box and Tangential-Velocity Polynomial Coefficients will not.

Tangential Velocity Profile  
contains a drop-down list from which you can select a boundary profile or a user-defined function for the definition of the tangential velocity. This item will appear if you enable Profile Specification of Tangential Velocity.

Tangential-Velocity Polynomial Coefficients  
sets the coefficients for the tangential velocity polynomial. Separate the coefficients by spaces.

Profile Specification of Radial Velocity  
enables the use of a boundary profile or user-defined function for the radial velocity specification. See Profiles (p. 377) or the UDF Manual for details. When this option is enabled, Radial Velocity Profile will appear in the dialog box and Radial-Velocity Polynomial Coefficients will not.
Radial Velocity Profile
contains a drop-down list from which you can select a boundary profile or a user-defined function for the definition of the radial velocity. This item will appear if you enable Profile Specification of Radial Velocity.

Radial-Velocity Polynomial Coefficients
sets the coefficients for the radial velocity polynomial. Separate the coefficients by spaces.

35.8.5. Inlet Vent Dialog Box

The Inlet Vent dialog box sets the boundary conditions for an inlet vent zone. It is opened from the Boundary Conditions Task Page (p. 2102). See Inputs at Inlet Vent Boundaries (p. 284) for details about defining the items below.

![Inlet Vent Dialog Box](image)

Controls

Zone Name
sets the name of the zone.

Momentum
contains the momentum parameters.
Reference Frame
specifies the reference frame for the mass flow. If the cell zone adjacent to the mass-flow inlet is moving, you can choose to specify relative or absolute velocities by selecting Relative to Adjacent Cell Zone or Absolute in the Reference Frame drop-down list.

Gauge Total Pressure
sets the gauge total (or stagnation) pressure of the inflow stream. If you are using moving reference frames, see Defining Total Pressure and Temperature (p. 264) for information about relative and absolute total pressure.

Supersonic/Initial Gauge Pressure
sets the static pressure on the boundary when the flow becomes (locally) supersonic. It is also used to compute initial values for pressure, temperature, and velocity if the inlet vent boundary condition is selected for computing initial values (see Initializing the Entire Flow Field Using Standard Initialization (p. 1445)).

Direction Specification Method
specifies the method you will use to define the flow direction. If you choose Direction Vector, you will define the flow direction components, and if you choose Normal to Boundary no inputs are required. See Defining the Flow Direction (p. 265) for information on specifying flow direction.

Coordinate System
specifies whether Cartesian, Cylindrical, Local Cylindrical, Local Cylindrical Swirl vector components will be input. This item will appear only for 3D cases in which you have selected Direction Vector as the Direction Specification Method.

X,Y,Z-Component of Flow Direction
set the direction of the flow at the inlet boundary. These items will appear if the selected Coordinate System is Cartesian or the model is 2D non-axisymmetric.

Radial, Tangential, Axial Component of Flow Direction
set the direction of the flow at the inlet boundary. These items will appear for 2D axisymmetric cases, or for 3D cases for which the selected Coordinate System is Cylindrical or Local Cylindrical.

X,Y,Z-Component of Axis Direction
sets the direction of the axis. These items will appear if the selected Coordinate System is Local Cylindrical.

X,Y,Z-Coordinate of Axis Origin
sets the location of the axis origin. These items will appear if the selected Coordinate System is Local Cylindrical.

Loss-Coefficient
sets the non-dimensional loss coefficient used to compute the pressure drop. See Specifying the Loss Coefficient (p. 286) for details.

Turbulence
lists the turbulence parameters.

Specification Method
specifies which method will be used to input the turbulence parameters. You can choose K and Epsilon (k-ε models and RSM only), K and Omega (k-ω models only), Intensity and Length Scale, Intensity and Viscosity Ratio, Intensity and Hydraulic Diameter, or Turbulent Viscosity Ratio (Spalart-Allmaras model only). See Determining Turbulence Parameters (p. 257) for inform-
ation about the inputs for each of these methods. (This item will appear only for turbulent flow calculations.)

**Turbulent Kinetic Energy, Turbulent Dissipation Rate**
set values for the turbulence kinetic energy $k$ and its dissipation rate $\epsilon$. These items will appear if you choose K and Epsilon as the Specification Method.

**Turbulent Kinetic Energy, Specific Dissipation Rate**
set values for the turbulence kinetic energy $k$ and its specific dissipation rate $\omega$. These items will appear if you choose K and Omega as the Specification Method.

**Turbulence Intensity, Turbulence Length Scale**
set values for turbulence intensity $I$ and turbulence length scale $\ell$. These items will appear if you choose Intensity and Length Scale as the Specification Method.

**Turbulence Intensity, Turbulent Viscosity Ratio**
set values for turbulence intensity $I$ and turbulent viscosity ratio $\mu_t / \mu$. These items will appear if you choose Intensity and Viscosity Ratio as the Specification Method.

**Turbulence Intensity, Hydraulic Diameter**
set values for turbulence intensity $I$ and hydraulic diameter $L$. These items will appear if you choose Intensity and Hydraulic Diameter as the Specification Method.

**Turbulent Viscosity Ratio**
sets the value of the turbulent viscosity ratio $\mu_t / \mu$. This item will appear if you choose Turbulent Viscosity Ratio as the Specification Method.

**Reynolds-Stress Specification Method**
specifies which method will be used to determine the Reynolds stress boundary conditions when the Reynolds stress turbulence model is used. You can choose either K or Turbulence Intensity or Reynolds-Stress Components. If you choose the former, ANSYS Fluent will compute the Reynolds stresses for you. If you choose the latter, you will explicitly specify the Reynolds stresses yourself. See Reynolds Stress Model (p. 742) for details. (This item will appear only for RSM turbulent flow calculations.)

**UU, VV, WW, UV, VW, UW Reynolds Stresses**
specify the Reynolds stress components when Reynolds-Stress Components is chosen as the Reynolds-Stress Specification Method.

**Thermal**
contains the thermal parameters.

**Total Temperature**
sets the total temperature of the inflow stream. If you are using moving reference frames, see Defining Total Pressure and Temperature (p. 264) for information about relative and absolute total temperature.

**Radiation**
contains the radiation parameters.

**External Black Body Temperature Method, Internal Emissivity**
set the radiation boundary conditions when you are using the P-1 model, the DTRM, the discrete ordinates model, or the S2S model for radiation heat transfer. See Defining Boundary Conditions for Radiation (p. 798) for details.
Participates in Solar Ray Tracing
specifies whether or not the inlet vent participates in solar ray tracing.

Solar Transmissivity Factor
specifies a multiplier (ranging from 0 to 1) that is applied to the solar irradiation entering the domain through the inlet vent.

Participates in View Factor Calculation
specifies whether or not the inlet vent participates in the view factor calculation as part of the S2S radiation model. This parameter is available only if you select the Surface to Surface radiation model.

Species
contains the species parameters.

Specify Species in Mole Fractions
allows you to specify the species in mole fractions rather than mass fractions.

Species Mass Fractions
contains inputs for the mass fractions of defined species. See Defining Cell Zone and Boundary Conditions for Species (p. 910) for details about these inputs. (These items will appear only if you are modeling non-reacting multi-species flow or you are using the finite-rate reaction formulation.)

Mean Mixture Fraction, Mixture Fraction Variance
set inlet values for the PDF mixture fraction and its variance. (These items will appear only if you are using the non-premixed or partially premixed combustion model.)

Secondary Mean Mixture Fraction, Secondary Mixture Fraction Variance
set inlet values for the secondary mixture fraction and its variance. (These items will appear only if you are using the non-premixed or partially premixed combustion model with two mixture fractions.)

Progress Variable
sets the value of the progress variable for premixed turbulent combustion. See Setting Boundary Conditions for the Progress Variable (p. 1008) for details.

This item will appear only if the premixed or partially premixed combustion model is used.

DPM
contains the discrete phase parameters.

Discrete Phase BC Type
sets the way that the discrete phase behaves with respect to the boundary. This item appears when one or more injections have been defined.

reflect
rebounds the particle off the boundary with a change in its momentum as defined by the coefficient of restitution. (See Figure 24.23: “Reflect” Boundary Condition for the Discrete Phase (p. 1190))

trap
terminates the trajectory calculations and records the fate of the particle as “trapped.” In the case of evaporating droplets, their entire mass instantaneously passes into the vapor phase and enters the cell adjacent to the boundary. See Figure 24.24: “Trap” Boundary Condition for the Discrete Phase (p. 1191).
**escape**
reports the particle as having “escaped” when it encounters the boundary. Trajectory calculations are terminated. See Figure 24.25: “Escape” Boundary Condition for the Discrete Phase (p. 1191).

**wall-jet**
indicates that the direction and velocity of the droplet particles are given by the resulting momentum flux, which is a function of the impingement angle. See Figure 16.2: “Wall Jet” Boundary Condition for the Discrete Phase in the Theory Guide.

**wall-film**
consists of four regimes: stick, rebound, spread, and splash, which are based on the impact energy and wall temperature. Detailed information on the wall-film model can be found in Wall-Film Model Theory in the Theory Guide. The **Number Of Splashed Drops** must be specified.

**user-defined**
specifies a user-defined function to define the discrete phase boundary condition type.

**Discrete Phase BC Function**
sets the user-defined function from the drop-down list.

**Multiphase**
contains the multiphase parameters.

**Granular Temperature**
specifies temperature for the solids phase and is proportional to the kinetic energy of the random motion of the particles.

**Volume Fraction**
specifies the volume fraction of the secondary phase selected in the Boundary Conditions Task Page (p. 2102). This section of the dialog box will appear when one of the multiphase models is being used. See Defining Multiphase Cell Zone and Boundary Conditions (p. 1260) for details.

**Open Channel**
is available when the VOF model with open channel flow is enabled.

**Secondary Phase for Inlet**
is where the specified parameters are valid only for one secondary phase. In case of a three-phase flow, select the corresponding secondary phase from this list. This appears when Open Channel is enabled.

**Flow Specification Method**
allows you to select the type of flow. You can choose Free Surface Level and Velocity, Total Height and Velocity, or Free Surface Level and Total Height. This appears when Open Channel is enabled.

**Free Surface Level**
can be determined using the absolute value of height from the free surface to the origin in the direction of gravity, or by applying the correct sign based on whether the free surface level is above or below the origin.

**Total Height**
is used as an option for describing the flow. It is given by Equation 25.3 (p. 1279).

**Bottom Level**
is valid only for shallow waves. The bottom level is used for calculating the liquid height.
Velocity Magnitude
sets the magnitude of the velocity vector at the inflow boundary.

Level-Set Function Flux
appears if the Level Set option is enabled for the VOF model.

UDS
contains the UDS parameters.

User-Defined Scalar Boundary Condition
appears only if user defines scalars are specified.

User Scalar-n
specifies whether the scalar is a specified flux or a specified value.

User-Defined Scalar Boundary Value
appears only if user defines scalars are specified.

User Scalar-n
specifies the value of the scalar.

35.8.6. Intake Fan Dialog Box

The Intake Fan dialog box sets the boundary conditions for an intake fan zone. It is opened from the Boundary Conditions Task Page (p. 2102). See Inputs at Intake Fan Boundaries (p. 287) for details about defining the items below.
### Controls

#### Zone Name

sets the name of the zone.

#### Momentum

contains the momentum parameters.

### Reference Frame

specifies the reference frame for the mass flow. If the cell zone adjacent to the mass-flow inlet is moving, you can choose to specify relative or absolute velocities by selecting **Relative to Adjacent Cell Zone** or **Absolute** in the **Reference Frame** drop-down list.
Gauge Total Pressure
sets the gauge total (or stagnation) pressure of the inflow stream. If you are using moving reference frames, see Defining Total Pressure and Temperature (p. 264) for information about relative and absolute total pressure.

Supersonic/Initial Gauge Pressure
sets the static pressure on the boundary when the flow becomes (locally) supersonic. It is also used to compute initial values for pressure, temperature, and velocity if the intake fan boundary condition is selected for computing initial values (see Initializing the Entire Flow Field Using Standard Initialization (p. 1445)).

Direction Specification Method
specifies the method you will use to define the flow direction. If you choose Direction Vector, you will define the flow direction components, and if you choose Normal to Boundary no inputs are required. See Defining the Flow Direction (p. 265) for information on specifying flow direction.

Coordinate System
specifies whether Cartesian, Cylindrical, Local Cylindrical, or Local Cylindrical Swirl vector components will be input. This item will appear only for 3D cases in which you have selected Direction Vector as the Direction Specification Method.

X,Y,Z-Component of Flow Direction
set the direction of the flow at the inlet boundary. For compressible flow, if the inflow becomes supersonic, the velocity is not reoriented. These items will appear if the selected Coordinate System is Cartesian or the model is 2D non-axisymmetric.

Radial, Tangential, Axial Component of Flow Direction
set the direction of the flow at the inlet boundary. For compressible flow, if the inflow becomes supersonic, the velocity is not reoriented. These items will appear for 2D axisymmetric cases, or for 3D cases for which the selected Coordinate System is Cylindrical or Local Cylindrical.

Pressure-Jump
specifies the rise in pressure across the fan. See Specifying the Pressure Jump (p. 288) for details.

X,Y,Z-Coordinate of Axis Origin
sets the location of the axis origin. These items will appear if the selected Coordinate System is Local Cylindrical.

X,Y,Z-Component of Axis Direction
sets the direction of the axis. These items will appear if the selected Coordinate System is Local Cylindrical.

Turbulence
consists of the turbulence parameters.

Specification Method
specifies which method will be used to input the turbulence parameters. You can choose K and Epsilon (k-\varepsilon models and RSM only), K and Omega (k-\omega models only), Intensity and Length Scale, Intensity and Viscosity Ratio, Intensity and Hydraulic Diameter, or Turbulent Viscosity Ratio (Spalart-Allmaras model only). See Determining Turbulence Parameters (p. 257) for information about the inputs for each of these methods. (This item will appear only for turbulent flow calculations.)
**Turbulent Kinetic Energy, Turbulent Dissipation Rate**
set values for the turbulence kinetic energy $k$ and its dissipation rate $\epsilon$. These items will appear if you choose **K and Epsilon** as the **Specification Method**.

**Turbulent Kinetic Energy, Specific Dissipation Rate**
set values for the turbulence kinetic energy $k$ and its specific dissipation rate $\omega$. These items will appear if you choose **K and Omega** as the **Specification Method**.

**Turbulent Intensity, Turbulent Length Scale**
set values for turbulence intensity $I$ and turbulence length scale $\ell$. These items will appear if you choose **Intensity and Length Scale** as the **Specification Method**.

**Turbulent Intensity, Turbulent Viscosity Ratio**
set values for turbulence intensity $I$ and turbulent viscosity ratio $\mu_t / \mu$. These items will appear if you choose **Intensity and Viscosity Ratio** as the **Specification Method**.

**Turbulent Intensity, Hydraulic Diameter**
set values for turbulence intensity $I$ and hydraulic diameter $L$. These items will appear if you choose **Intensity and Hydraulic Diameter** as the **Specification Method**.

**Turbulent Viscosity Ratio**
sets the value of the turbulent viscosity ratio $\mu_t / \mu$. This item will appear if you choose **Turbulent Viscosity Ratio** as the **Specification Method**.

**Reynolds-Stress Specification Method**
specifies which method will be used to determine the Reynolds stress boundary conditions when the Reynolds stress turbulence model is used. You can choose either **K or Turbulent Intensity** or **Reynolds-Stress Components**. If you choose the former, ANSYS Fluent will compute the Reynolds stresses for you. If you choose the latter, you will explicitly specify the Reynolds stresses yourself. See **Reynolds Stress Model (p. 742)** for details. (This item will appear only for RSM turbulent flow calculations.)

**UU, VV, WW, UV, VW, UW Reynolds Stresses**
specify the Reynolds stress components when **Reynolds-Stress Components** is chosen as the **Reynolds-Stress Specification Method**.

**Thermal**
contains the thermal parameters.

**Total Temperature**
sets the total temperature of the inflow stream. If you are using moving reference frames, see **Defining Total Pressure and Temperature (p. 264)** for information about relative and absolute total temperature.

**Radiation**
contains the radiation parameters.

**External Black Body Temperature Method, Internal Emissivity**
set the radiation boundary conditions when you are using the P-1 model, the DTRM, the discrete ordinates model, or the S2S model for radiation heat transfer. See **Defining Boundary Conditions for Radiation (p. 798)** for details.

**Participates in Solar Ray Tracing**
specifies whether or not the intake fan participates in solar ray tracing.
**Solar Transmissivity Factor**
specifies a multiplier (ranging from 0 to 1) that is applied to the solar irradiation entering the domain through the intake fan.

**Participates in View Factor Calculation**
specifies whether or not the intake fan participates in the view factor calculation as part of the S2S radiation model. This parameter is available only if you select the **Surface to Surface** radiation model.

**Species**
contains the species parameters.

**Specify Species in Mole Fractions**
allows you to specify the species in mole fractions rather than mass fractions.

**Species Mass Fractions**
contains inputs for the mass fractions of defined species. See [Defining Cell Zone and Boundary Conditions for Species (p. 910)] for details about these inputs. (These items will appear only if you are modeling non-reacting multi-species flow or you are using the finite-rate reaction formulation.)

**Mean Mixture Fraction, Mixture Fraction Variance**
set inlet values for the PDF mixture fraction and its variance. (These items will appear only if you are using the non-premixed or partially premixed combustion model.)

**Secondary Mean Mixture Fraction, Secondary Mixture Fraction Variance**
set inlet values for the secondary mixture fraction and its variance. (These items will appear only if you are using the non-premixed or partially premixed combustion model with two mixture fractions.)

**Progress Variable**
sets the value of the progress variable for premixed turbulent combustion. See [Setting Boundary Conditions for the Progress Variable (p. 1008)] for details.

This item will appear only if the premixed or partially premixed combustion model is used.

**DPM**
contains the discrete phase parameters.

**Discrete Phase BC Type**
sets the way that the discrete phase behaves with respect to the boundary. This item appears when one or more injections have been defined.

- **reflect**
  rebounds the particle off the boundary with a change in its momentum as defined by the coefficient of restitution. (See [Figure 24.23: “Reflect” Boundary Condition for the Discrete Phase (p. 1190)])

- **trap**
  terminates the trajectory calculations and records the fate of the particle as “trapped”. In the case of evaporating droplets, their entire mass instantaneously passes into the vapor phase and enters the cell adjacent to the boundary. See [Figure 24.24: “Trap” Boundary Condition for the Discrete Phase (p. 1191)].

- **escape**
  reports the particle as having “escaped” when it encounters the boundary. Trajectory calculations are terminated. See [Figure 24.25: “Escape” Boundary Condition for the Discrete Phase (p. 1191)].
**wall-jet**
indicates that the direction and velocity of the droplet particles are given by the resulting momentum flux, which is a function of the impingement angle. See Figure 16.2: “Wall Jet” Boundary Condition for the Discrete Phase in the Theory Guide.

**wall-film**
consists of four regimes: stick, rebound, spread, and splash, which are based on the impact energy and wall temperature. Detailed information on the wall-film model can be found in Wall-Film Model Theory in the Theory Guide. The Number Of Splashed Drops must be specified.

**user-defined**
specifies a user-defined function to define the discrete phase boundary condition type.

**Discrete Phase BC Function**
sets the user-defined function from the drop-down list.

**Multiphase**
contains the multiphase parameters.

**Granular Temperature**
specifies temperature for the solids phase and is proportional to the kinetic energy of the random motion of the particles.

**Volume Fraction**
specifies the volume fraction of the secondary phase selected in the Boundary Conditions Task Page (p. 2102). This section of the dialog box will appear when one of the multiphase models is being used. See Defining Multiphase Cell Zone and Boundary Conditions (p. 1260) for details.

**UDS**
contains the UDS parameters.

**User-Defined Scalar Boundary Condition**
appears only if user defines scalars are specified.

**User Scalar-n**
specifies whether the scalar is a specified flux or a specified value.

**User-Defined Scalar Boundary Value**
appears only if user defines scalars are specified.

**User Scalar-n**
specifies the value of the scalar.

### 35.8.7. Interface Dialog Box

The **Interface** dialog box can be used to modify the name of an interface zone; there are no conditions to be set. It is opened from the Boundary Conditions Task Page (p. 2102). Interface zones are used for multiple reference frame and sliding mesh calculations, and for non-conformal meshes. See The Multiple Reference Frame Model (p. 545), Setting Up the Sliding Mesh Problem (p. 566), and Non-Conformal Meshes (p. 148) for details.
Controls

Zone Name
sets the name of the zone.

Phase
displays the name of the phase. This item appears only for multiphase flows.

35.8.8. Interior Dialog Box

The Interior dialog box can be used to modify the name of an interior zone; there are no conditions to be set. It is opened from the Boundary Conditions Task Page (p. 2102).

Controls

Zone Name
sets the name of the zone.

Phase
displays the name of the phase. This item appears only for multiphase flows.

35.8.9. Mass-Flow Inlet Dialog Box

The Mass-Flow Inlet dialog box sets the boundary conditions for a mass-flow inlet zone. It is opened from the Boundary Conditions Task Page (p. 2102). See Inputs at Mass Flow Inlet Boundaries (p. 277) for details about defining the items below.
## Controls

### Zone Name
sets the name of the zone.

### Momentum
displays the momentum boundary conditions.

### Reference Frame
specifies the reference frame for the mass flow. If the cell zone adjacent to the mass-flow inlet is moving, you can choose to specify relative or absolute velocities by selecting Relative to Adjacent Cell Zone or Absolute in the Reference Frame drop-down list.

### Mass Flow Specification Method
specifies whether you are defining Mass Flow Rate, Mass Flux, or Mass Flux with Average Mass Flux.

### Mass Flow Rate
sets the prescribed mass flow rate for the zone. This flow rate is converted internally to a prescribed uniform mass flux over the zone by dividing the flow rate by the flow direction area projection of

the zone. This item will appear if you selected **Mass Flow Rate** in the **Mass Flow Specification Method** list.

**Important**

Note that for axisymmetric problems, this mass flow rate is the flow rate through the entire \((2\pi\text{-radian})\) domain, not through a 1-radian slice.

**Mass Flux**

sets the prescribed mass flux for the zone. This item will appear if you selected **Mass Flux** or **Mass Flux with Average Mass Flux** in the **Mass Flow Specification Method** list.

**Important**

Note that for axisymmetric problems, this mass flux is the flux through a 1-radian slice of the domain.

**Average Mass Flux**

sets the average mass flux through the zone. See More About Mass Flux and Average Mass Flux (p. 279) for details. This item will appear if you selected **Mass Flux with Average Mass Flux** in the **Mass Flow Specification Method** list.

**Important**

Note that for axisymmetric problems, this mass flux is the flux through a 1-radian slice of the domain.

**Supersonic/Initialization Gauge Pressure**

sets the static pressure that will be used to initialize the flow field if the mass flow inlet boundary condition is selected for initializing flow properties (see Initializing the Entire Flow Field Using Standard Initialization (p. 1445)).

**Direction Specification Method**

specifies the method you will use to define the flow direction. If you choose **Direction Vector**, you will define the flow direction components, and if you choose **Normal to Boundary** no inputs are required. See Defining the Flow Direction (p. 265) for information on specifying flow direction.

**Coordinate System**

specifies whether **Cartesian**, **Cylindrical**, **Local Cylindrical**, or **Local Cylindrical Swirl** vector components will be input. This item will appear only for 3D cases in which you have selected **Direction Vector** as the **Direction Specification Method**.

**X,Y,Z-Component of Flow-Direction**

set the velocity-direction vector of the inflow stream. This vector does not need to be normalized (for example, you can specify the vector \((1 1 1)\) rather than \((0.577 0.577 0.577)\)). These items will appear if the selected **Coordinate System** is **Cartesian** or the model is 2D non-axisymmetric.

**Radial-, Tangential-, Axial-Component of Flow Direction**

set the velocity-direction vector of the inflow stream. These items will appear for 2D axisymmetric cases, or for 3D cases for which the selected **Coordinate System** is **Cylindrical** or **Local Cylindrical**.
Radial-, Axial-Component of Flow Direction and Tangential-Component of Velocity
appear for a 3D Local Cylindrical Swirl coordinate system. Specify the X, Y, and Z-Component of
Axis Direction and the X, Y, and Z-Coordinate of Axis Origin.

Turbulence
contains the turbulence parameters.

**Specification Method**
specifies which method will be used to input the turbulence parameters. You can choose **K and Epsilon** (k-ε models and RSM only), **K and Omega** (k-ω models only), **Intensity and Length Scale, Intensity and Viscosity Ratio, Intensity and Hydraulic Diameter**, or **Turbulent Viscosity Ratio** (Spalart-Allmaras model only). See Determining Turbulence Parameters (p. 257) for information about the inputs for each of these methods. (This item will appear only for turbulent flow calculations.)

**Turbulent Kinetic Energy, Turbulent Dissipation Rate**
set values for the turbulence kinetic energy $k$ and its dissipation rate $\varepsilon$. These items will appear if you choose **K and Epsilon** as the **Specification Method**.

**Turbulent Kinetic Energy, Specific Dissipation Rate**
set values for the turbulence kinetic energy $k$ and its specific dissipation rate $\omega$. These items will appear if you choose **K and Omega** as the **Specification Method**.

**Turbulent Intensity, Turbulent Length Scale**
set values for turbulence intensity $I$ and turbulence length scale $\ell$. These items will appear if you choose **Intensity and Length Scale** as the **Specification Method**.

**Turbulent Intensity, Turbulent Viscosity Ratio**
set values for turbulence intensity $I$ and turbulent viscosity ratio $\mu_t / \mu$. These items will appear if you choose **Intensity and Viscosity Ratio** as the **Specification Method**.

**Turbulent Intensity, Hydraulic Diameter**
set values for turbulence intensity $I$ and hydraulic diameter $L$. These items will appear if you choose **Intensity and Hydraulic Diameter** as the **Specification Method**.

**Turbulent Viscosity Ratio**
sets the value of the turbulent viscosity ratio $\mu_t / \mu$. This item will appear if you choose **Turbulent Viscosity Ratio** as the **Specification Method**.

**Reynolds-Stress Specification Method**
specifies which method will be used to determine the Reynolds stress boundary conditions when the Reynolds stress turbulence model is used. You can choose either **K or Turbulent Intensity** or **Reynolds-Stress Components**. If you choose the former, ANSYS Fluent will compute the Reynolds stresses for you. If you choose the latter, you will explicitly specify the Reynolds stresses yourself. See Reynolds Stress Model (p. 742) for details. (This item will appear only for RSM turbulent flow calculations.)

**UU, VV, WW, UV, VW, UW Reynolds Stresses**
specify the Reynolds stress components when **Reynolds-Stress Components** is chosen as the **Reynolds-Stress Specification Method**.

**Thermal**
contains the thermal parameters.
**Total Temperature**
sets the total temperature of the inflow stream.

**Radiation**
contains the radiation parameters.

**External Black Body Temperature Method, Internal Emissivity**
set the radiation boundary conditions when you are using the P-1 model, the DTRM, the discrete ordinates model, or the S2S model for radiation heat transfer. See Defining Boundary Conditions for Radiation (p. 798) for details.

**Participates in Solar Ray Tracing**
specifies whether or not the mass-flow inlet participates in solar ray tracing.

**Solar Transmissivity Factor**
specifies a multiplier (ranging from 0 to 1) that is applied to the solar irradiation entering the domain through the mass-flow inlet.

**Participates in View Factor Calculation**
specifies whether or not the mass-flow inlet participates in the view factor calculation as part of the S2S radiation model. This parameter is available only if you select the **Surface to Surface** radiation model.

**Species**
contains the species parameters.

**Specify Species in Mole Fractions**
allows you to specify the species in mole fractions rather than mass fractions.

**Species Mass Fractions**
contains inputs for the mass fractions of defined species. See Defining Cell Zone and Boundary Conditions for Species (p. 910) for details about these inputs. These items will appear only if you are modeling non-reacting multi-species flow or you are using the finite-rate reaction formulation.

**Progress Variable**
sets the value of the progress variable for premixed turbulent combustion. See Setting Boundary Conditions for the Progress Variable (p. 1008) for details.

This item will appear only if the premixed or partially premixed combustion model is used.

**Mean Mixture Fraction, Mixture Fraction Variance**
set inlet values for the PDF mixture fraction and its variance. (These items will appear only if you are using the non-premixed or partially premixed combustion model.)

**Secondary Mean Mixture Fraction, Secondary Mixture Fraction Variance**
set inlet values for the secondary mixture fraction and its variance. (These items will appear only if you are using the non-premixed or partially premixed combustion model with two mixture fractions.)

**DPM**
contains the discrete phase parameters.

**Discrete Phase BC Type**
sets the way that the discrete phase behaves with respect to the boundary. This item appears when one or more injections have been defined.
**reflect**
rebounds the particle off the boundary with a change in its momentum as defined by the coefficient of restitution. (See Figure 24.23: “Reflect” Boundary Condition for the Discrete Phase (p. 1190))

**trap**
terminates the trajectory calculations and records the fate of the particle as “trapped”. In the case of evaporating droplets, their entire mass instantaneously passes into the vapor phase and enters the cell adjacent to the boundary. See Figure 24.24: “Trap” Boundary Condition for the Discrete Phase (p. 1191).

**escape**
reports the particle as having “escaped” when it encounters the boundary. Trajectory calculations are terminated. See Figure 24.25: “Escape” Boundary Condition for the Discrete Phase (p. 1191).

**wall-jet**
indicates that the direction and velocity of the droplet particles are given by the resulting momentum flux, which is a function of the impingement angle. See Figure 16.2: “Wall Jet” Boundary Condition for the Discrete Phase in the Theory Guide.

**wall-film**
consists of four regimes: stick, rebound, spread, and splash, which are based on the impact energy and wall temperature. Detailed information on the wall-film model can be found in Wall-Film Model Theory in the Theory Guide. The Number Of Splashed Drops must be specified.

**user-defined**
specifies a user-defined function to define the discrete phase boundary condition type.

**Discrete Phase BC Function**
sets the user-defined function from the drop-down list.

**UDS**
contains the UDS parameters.

**User-Defined Scalar Boundary Condition**
appears only if user defines scalars are specified.

**User Scalar-n**
specifies whether the scalar is a specified flux or a specified value.

**User-Defined Scalar Boundary Value**
appears only if user defines scalars are specified.

**User Scalar-n**
specifies the value of the scalar.

### 35.8.10. Outflow Dialog Box

The Outflow dialog box sets the boundary conditions for an outflow zone. It is opened from the Boundary Conditions Task Page (p. 2102). See Using Outflow Boundaries (p. 302) for details about using outflow boundaries.
Controls

Zone Name
sets the name of the zone.

Flow Rate Weighting
specifies the portion of the outflow that is going through the boundary. See Mass Flow Split Boundary Conditions (p. 303) for details.

External Black Body Temperature Method, Internal Emissivity
set the radiation boundary conditions when you are using the P-1 model, the DTRM, the discrete ordinates model, or the S2S model for radiation heat transfer. See Defining Boundary Conditions for Radiation (p. 798) for details.

Discrete Phase BC Type
sets the way that the discrete phase behaves with respect to the boundary. This item appears when one or more injections have been defined.

reflect
rebounds the particle off the boundary with a change in its momentum as defined by the coefficient of restitution. (See Figure 24.23: “Reflect” Boundary Condition for the Discrete Phase (p. 1190))

trap
terminates the trajectory calculations and records the fate of the particle as “trapped.” In the case of evaporating droplets, their entire mass instantaneously passes into the vapor phase and enters the cell adjacent to the boundary. See Figure 24.24: “Trap” Boundary Condition for the Discrete Phase (p. 1191).

escape
reports the particle as having “escaped” when it encounters the boundary. Trajectory calculations are terminated. See Figure 24.25: “Escape” Boundary Condition for the Discrete Phase (p. 1191).

wall-jet
indicates that the direction and velocity of the droplet particles are given by the resulting momentum flux, which is a function of the impingement angle. See Figure 16.2: “Wall Jet” Boundary Condition for the Discrete Phase in the Theory Guide.
wall-film
consists of four regimes: stick, rebound, spread, and splash, which are based on the impact energy and wall temperature. Detailed information on the wall-film model can be found in Wall-Film Model Theory in the Theory Guide. The **Number Of Splashed Drops** must be specified.

**user-defined**
specifies a user-defined function to define the discrete phase boundary condition type.

**Participates in Solar Ray Tracing**
specifies whether or not outflow participate in solar ray tracing.

**Solar Transmissivity Factor**
specifies a multiplier (ranging from 0 to 1) that is applied to the solar irradiation entering the domain through the outflow.

**Discrete Phase BC Function**
sets the user-defined function from the drop-down list.

**Participates in View Factor Calculation**
specifies whether or not the outflow participates in the view factor calculation as part of the S2S radiation model. This parameter is available only if you select the **Surface to Surface** radiation model.

### 35.8.11. Outlet Vent Dialog Box

The **Outlet Vent** dialog box sets the boundary conditions for an outlet vent zone. It is opened from the **Boundary Conditions Task Page** (p. 2102). See **Inputs at Outlet Vent Boundaries** (p. 304) for details about defining the items below.
Controls

Zone Name
sets the name of the zone.

Momentum
contains the momentum parameters.

Gauge Pressure
sets the gauge pressure at the outlet boundary.

Radial Equilibrium Pressure Distribution
enables the radial equilibrium pressure distribution. See Defining Static Pressure (p. 290) for details.

This item appears only for 3D and axisymmetric swirl solvers.

Backflow Direction Specification Method
specifies the method you will use to define the flow direction. If you choose Direction Vector, you will define the flow direction components, and if you choose Normal to Boundary or From Neighboring Cell no inputs are required. See Defining the Flow Direction (p. 265) for information on specifying flow direction.

Target Mass Flow Rate
allows you to set mass flow rate as a boundary condition at the outlet.

Loss-Coefficient
sets the non-dimensional loss coefficient used to compute the pressure drop. See Specifying the Loss Coefficient (p. 306) for details.

Turbulence
contains the turbulence parameters.

Specification Method
specifies which method will be used to input the turbulence parameters. You can choose K and Epsilon (k-ε models and RSM only), K and Omega (k-ω models only), Intensity and Length Scale, Intensity and Viscosity Ratio, Intensity and Hydraulic Diameter, or Turbulent Viscosity Ratio (Spalart-Allmaras model only). See Determining Turbulence Parameters (p. 257) for information about the inputs for each of these methods. (This item will appear only for turbulent flow calculations.)

Backflow Turbulent Kinetic Energy, Backflow Turbulent Dissipation Rate
set values for the turbulence kinetic energy \( \kappa \) and its dissipation rate \( \varepsilon \). These items will appear if you choose K and Epsilon as the Specification Method.

Backflow Turbulent Kinetic Energy, Backflow Specific Dissipation Rate
set values for the turbulence kinetic energy \( \kappa \) and its specific dissipation rate \( \omega \). These items will appear if you choose K and Omega as the Specification Method.

Backflow Turbulent Intensity, Backflow Turbulent Length Scale
set values for turbulence intensity \( I \) and turbulence length scale \( \ell \). These items will appear if you choose Intensity and Length Scale as the Specification Method.
**Backflow Turbulent Intensity, Backflow Turbulent Viscosity Ratio**
set values for turbulence intensity $I$ and turbulent viscosity ratio $\mu_t/\mu$. These items will appear if you choose **Intensity and Viscosity Ratio** as the **Specification Method**.

**Backflow Turbulent Intensity, Backflow Hydraulic Diameter**
set values for turbulence intensity $I$ and hydraulic diameter $L$. These items will appear if you choose **Intensity and Hydraulic Diameter** as the **Specification Method**.

**Backflow Turbulent Viscosity Ratio**
sets the value of the backflow turbulent viscosity ratio $\mu_t/\mu$. This item will appear if you choose **Turbulent Viscosity Ratio** as the **Specification Method**.

**Reynolds-Stress Specification Method**
specifies which method will be used to determine the backflow Reynolds stress boundary conditions when the Reynolds stress turbulence model is used. You can choose either **K or Turbulent Intensity** or **Reynolds-Stress Components**. If you choose the former, ANSYS Fluent will compute the Reynolds stresses for you. If you choose the latter, you will explicitly specify the Reynolds stresses yourself. See [Reynolds Stress Model](p. 742) for details. (This item will appear only for RSM turbulent flow calculations.)

**Backflow UU, VV, WW, UV, VW, UW Reynolds Stresses**
specify the backflow Reynolds stress components when **Reynolds-Stress Components** is chosen as the **Reynolds-Stress Specification Method**.

**Thermal**
contains the thermal parameters.

**Backflow Total Temperature**
sets the total temperature of the inflow stream should the flow reverse direction.

**Radiation**
contains the boundary conditions for the radiation model at the outlet vent.

**External Black Body Temperature Method, Internal Emissivity**
set the radiation boundary conditions when you are using the P-1 model, the DTRM, the discrete ordinates model, or the S2S model for radiation heat transfer. See [Defining Boundary Conditions for Radiation](p. 798) for details.

**Participates in Solar Ray Tracing**
specifies whether or not the outlet vent participates in solar ray tracing.

**Solar Transmissivity Factor**
specifies a multiplier (ranging from 0 to 1) that is applied to the solar irradiation entering the domain through the outlet vent.

**Participates in View Factor Calculation**
specifies whether or not the outlet vent participates in the view factor calculation as part of the S2S radiation model. This parameter is available only if you select the **Surface to Surface** radiation model.

**Species**
contains the species parameters.
Specify Species in Mole Fractions
allows you to specify the species in mole fractions rather than mass fractions.

Mean Mixture Fraction, Mixture Fraction Variance
set inlet values for the PDF mixture fraction and its variance. (These items will appear only if you are using the non-premixed or partially premixed combustion model.)

Secondary Mean Mixture Fraction, Secondary Mixture Fraction Variance
set inlet values for the secondary mixture fraction and its variance. (These items will appear only if you are using the non-premixed or partially premixed combustion model with two mixture fractions.)

Species Mass Fractions
contains inputs for the mass fractions of defined species. See Defining Cell Zone and Boundary Conditions for Species (p. 910) for details about these inputs. These items will appear only if you are modeling non-reacting multi-species flow or you are using the finite-rate reaction formulation.

Backflow Progress Variable
sets the value of the progress variable for premixed turbulent combustion. See Setting Boundary Conditions for the Progress Variable (p. 1008) for details.

This item will appear only if the premixed or partially premixed combustion model is used.

DPM
contains the discrete phase parameters.

Discrete Phase BC Type
sets the way that the discrete phase behaves with respect to the boundary. This item appears when one or more injections have been defined.

reflect
rebounds the particle off the boundary with a change in its momentum as defined by the coefficient of restitution. (See Figure 24.23: “Reflect” Boundary Condition for the Discrete Phase (p. 1190))

trap
terminates the trajectory calculations and records the fate of the particle as “trapped.” In the case of evaporating droplets, their entire mass instantaneously passes into the vapor phase and enters the cell adjacent to the boundary. See Figure 24.24: “Trap” Boundary Condition for the Discrete Phase (p. 1191).

escape
reports the particle as having “escaped” when it encounters the boundary. Trajectory calculations are terminated. See Figure 24.25: “Escape” Boundary Condition for the Discrete Phase (p. 1191).

wall-jet
indicates that the direction and velocity of the droplet particles are given by the resulting momentum flux, which is a function of the impingement angle. See Figure 16.2: “Wall Jet” Boundary Condition for the Discrete Phase in the Theory Guide.

wall-film
consists of four regimes: stick, rebound, spread, and splash, which are based on the impact energy and wall temperature. Detailed information on the wall-film model can be found in Wall-Film Model Theory in the Theory Guide. The Number Of Splashed Drops must be specified.

user-defined
specifies a user-defined function to define the discrete phase boundary condition type.
**Discrete Phase BC Function**
sets the user-defined function from the drop-down list.

**Multiphase**
contains the multiphase parameters.

**Backflow Granular Temperature**
specifies temperature for the solids phase and is proportional to the kinetic energy of the random motion of the particles.

**Backflow Volume Fraction**
specifies the volume fraction of the secondary phase selected in the Boundary Conditions Task Page (p. 2102). This section of the dialog box will appear when one of the multiphase models is being used. See Defining Multiphase Cell Zone and Boundary Conditions (p. 1260) for details.

**UDS**
contains the UDS parameters.

**User-Defined Scalar Boundary Condition**
appears only if user defines scalars are specified.

**User Scalar-n**
specifies whether the scalar is a specified flux or a specified value.

**User-Defined Scalar Boundary Value**
appears only if user defines scalars are specified.

**User Scalar-n**
specifies the value of the scalar.

### 35.8.12. Periodic Dialog Box

The **Periodic** dialog box sets the boundary conditions for a periodic zone. It is opened from the Boundary Conditions Task Page (p. 2102). See Inputs for Periodic Boundaries (p. 333) for details about the items below. See Periodic Flows (p. 514) for information about fully-developed periodic flow.

![Periodic dialog box](image)

**Controls**

**Zone Name**
sets the name of the zone.
**Periodic Type**
indicates whether the periodicity of the domain is **Translational** or **Rotational**.

**Periodic Pressure Jump**
sets the pressure increase/decrease across the periodic boundary. (This item will not appear if the pressure-based (default) solver is used; it is relevant only for the density-based solvers.)

### 35.8.13. Porous Jump Dialog Box

The **Porous Jump** dialog box sets the boundary conditions for a porous-jump zone. It is opened from the **Boundary Conditions Task Page** (p. 2102). See **Porous Jump Boundary Conditions** (p. 350) for details about the items below.

![Porous Jump Dialog Box](image)

**Controls**

**Zone Name**
sets the name of the zone.

**Face Permeability**
sets the face permeability coefficient ($\alpha$ in **Equation 6.117** (p. 350)).

**Porous Medium Thickness**
sets the thickness of the porous medium ($\Delta m$).

**Pressure-Jump Coefficient**
sets the pressure-jump coefficient ($C_2$).

**Jump Adhesion**
sets the adhesion method and contact angle.

- **Constrained-Two-Sided Adhesion**
  constrains the contact angle at the porous jump. When this option is disabled then the forced two-sided adhesion treatment is in effect. See **Jump Adhesion** for more information.

- **Contact Angle**
is the contact angle at the porous jump.

**Discrete Phase BC Type**
sets the way that the discrete phase behaves with respect to the boundary. This item appears when one or more injections have been defined.
interior
allows the particles to pass through the boundary.

reflect
rebounds the particle off the boundary with a change in its momentum as defined by the coefficient of restitution. (See Figure 24.23: “Reflect” Boundary Condition for the Discrete Phase (p. 1190))

trap
terminates the trajectory calculations and records the fate of the particle as “trapped”. In the case of evaporating droplets, their entire mass instantaneously passes into the vapor phase and enters the cell adjacent to the boundary. See Figure 24.24: “Trap” Boundary Condition for the Discrete Phase (p. 1191).

escape
reports the particle as having “escaped” when it encounters the boundary. Trajectory calculations are terminated. See Figure 24.25: “Escape” Boundary Condition for the Discrete Phase (p. 1191).

wall-jet
indicates that the direction and velocity of the droplet particles are given by the resulting momentum flux, which is a function of the impingement angle. See Figure 16.2: “Wall Jet” Boundary Condition for the Discrete Phase in the Theory Guide.

wall-film
consists of four regimes: stick, rebound, spread, and splash, which are based on the impact energy and wall temperature. Detailed information on the wall-film model can be found in Wall-Film Model Theory in the Theory Guide. The Number Of Splashed Drops must be specified.

user-defined
specifies a user-defined function to define the discrete phase boundary condition type.

Discrete Phase BC Function
sets the user-defined function from the drop-down list.

Solar Boundary Conditions
contains the settings for solar ray tracing. This group box is available only if you select Solar Ray Tracing from the Model list in the Solar Load group box of the Radiation Model dialog box. See Solar Ray Tracing (p. 829) for details.

Participates in Solar Ray Tracing
specifies whether or not the porous jump participates in solar ray tracing.

Absorptivity
contains the settings that define the absorptivity of the porous jump.

Direct Visible
specifies a multiplier (ranging from 0 to 1) that is applied to the visible portion of the direct solar radiation spectrum to account for the absorption of the porous jump.

Direct IR
specifies a multiplier (ranging from 0 to 1) that is applied to the infrared portion of the direct solar radiation spectrum to account for the absorption of the porous jump.

Transmissivity
contains the settings that define the transmissivity of the porous jump.
Direct Visible
specifies a multiplier (ranging from 0 to 1) that is applied to the visible portion of the direct solar radiation spectrum to account for the transmissivity of the porous jump.

Direct IR
specifies a multiplier (ranging from 0 to 1) that is applied to the infrared portion of the direct solar radiation spectrum to account for the transmissivity of the porous jump.

35.8.14. Pressure Far-Field Dialog Box

The Pressure Far-Field dialog box sets the boundary conditions for a pressure far-field zone. It is opened from the Boundary Conditions Task Page (p. 2102). See Inputs at Pressure Far-Field Boundaries (p. 298) for details about defining the items below.

Controls

Zone Name
sets the name of the zone.

Momentum
contains the momentum parameters.

Gauge Pressure
sets the far-field gauge static pressure.
Mach Number
sets the far-field Mach number. The Mach number can be subsonic, sonic, or supersonic.

Coordinate System
allows you to select a Cartesian, Cylindrical, or Local Cylindrical coordinate system. This option is available only for 3D geometry.

X,Y,Z-Component of Flow-Direction
set the far-field flow direction. These items will appear if the selected Coordinate System is Cartesian or the model is 2D non-axisymmetric.

Radial, Tangential, Axial Component of Flow Direction
set the far-field flow direction. These items will appear for 2D axisymmetric cases, or for 3D cases for which the selected Coordinate System is Cylindrical or Local Cylindrical. Specify the X, Y, and Z-Component of Axis Direction and the X, Y, and Z-Coordinate of Axis Origin for the Local Cylindrical coordinate system.

Turbulence
contains the turbulence parameters.

Specification Method
specifies which method will be used to input the turbulence parameters. You can choose K and Epsilon ($k$-$\varepsilon$ models and RSM only), K and Omega ($k$-$\omega$ models only), Intensity and Length Scale, Intensity and Viscosity Ratio, Intensity and Hydraulic Diameter, or Turbulent Viscosity Ratio (Spalart-Allmaras model only). See Determining Turbulence Parameters (p. 257) for information about the inputs for each of these methods. (This item will appear only for turbulent flow calculations.)

Turbulent Kinetic Energy, Turbulent Dissipation Rate
set values for the turbulence kinetic energy $k$ and its dissipation rate $\varepsilon$. These items will appear if you choose K and Epsilon as the Specification Method.

Turbulent Kinetic Energy, Specific Dissipation Rate
set values for the turbulence kinetic energy $k$ and its specific dissipation rate $\omega$. These items will appear if you choose K and Omega as the Specification Method.

Turbulent Intensity, Turbulent Length Scale
set values for turbulence intensity $I$ and turbulence length scale $\ell$. These items will appear if you choose Intensity and Length Scale as the Specification Method.

Turbulent Intensity, Turbulent Viscosity Ratio
set values for turbulence intensity $I$ and turbulent viscosity ratio $\mu_t / \mu$. These items will appear if you choose Intensity and Viscosity Ratio as the Specification Method.

Turbulent Intensity, Hydraulic Diameter
set values for turbulence intensity $I$ and hydraulic diameter $L$. These items will appear if you choose Intensity and Hydraulic Diameter as the Specification Method.

Turbulent Viscosity Ratio
sets the value of the turbulent viscosity ratio $\mu_t / \mu$. This item will appear if you choose Turbulent Viscosity Ratio as the Turbulence Specification Method.
**Reynolds-Stress Specification Method**

specifies which method will be used to determine the Reynolds stress boundary conditions when the Reynolds stress turbulence model is used. You can choose either **K or Turbulent Intensity** or **Reynolds-Stress Components**. If you choose the former, ANSYS Fluent will compute the Reynolds stresses for you. If you choose the latter, you will explicitly specify the Reynolds stresses yourself. See **Reynolds Stress Model (p. 742)** for details. (This item will appear only for RSM turbulent flow calculations.)

**UU, VV, WW, UV, VW, UW Reynolds Stresses**

specify the Reynolds stress components when **Reynolds-Stress Components** is chosen as the **Reynolds-Stress Specification Method**.

**Thermal**

contains the thermal parameters.

**Temperature**

sets the far-field static temperature.

**Radiation**

contains the boundary conditions for the radiation model at the pressure far-field zone.

**External Black Body Temperature Method, Internal Emissivity**

set the radiation boundary conditions when you are using the P-1 model, the DTRM, the discrete ordinates model, or the S2S model for radiation heat transfer. See **Defining Boundary Conditions for Radiation (p. 798)** for details.

**Participates in Solar Ray Tracing**

specifies whether or not the pressure far-field zone participates in solar ray tracing.

**Solar Transmissivity Factor**

specifies a multiplier (ranging from 0 to 1) that is applied to the solar irradiation entering the domain through the pressure far-field zone.

**Participates in View Factor Calculation**

specifies whether or not the pressure far-field zone participates in the view factor calculation as part of the S2S radiation model. This parameter is available only if you select the **Surface to Surface** radiation model.

**Species**

contains the species parameters.

**Specify Species in Mole Fractions**

allows you to specify the species in mole fractions rather than mass fractions.

**Species Mass Fractions**

contains inputs for the mass fractions of defined species. See **Defining Cell Zone and Boundary Conditions for Species (p. 910)** for details about these inputs. (These items will appear only if you are modeling non-reacting multi-species flow or you are using the finite-rate reaction formulation.)

**Mean Mixture Fraction, Mixture Fraction Variance**

set inlet values for the PDF mixture fraction and its variance. (These items will appear only if you are using the non-premixed or partially premixed combustion model.)
Secondary Mean Mixture Fraction, Secondary Mixture Fraction Variance
set inlet values for the secondary mixture fraction and its variance. (These items will appear only if you are using the non-premixed or partially premixed combustion model with two mixture fractions.)

Progress Variable
sets the value of the progress variable for premixed turbulent combustion. See Setting Boundary Conditions for the Progress Variable (p. 1008) for details.

This item will appear only if the premixed or partially premixed combustion model is used.

UDS
contains the UDS parameters.

User-Defined Scalar Boundary Condition
appears only if user defines scalars are specified.

User Scalar-n
specifies whether the scalar is a specified flux or a specified value.

User-Defined Scalar Boundary Value
appears only if user defines scalars are specified.

User Scalar-n
specifies the value of the scalar.

DPM
contains the discrete phase parameters.

Discrete Phase BC Type
sets the way that the discrete phase behaves with respect to the boundary. This item appears when one or more injections have been defined.

reflect
rebounds the particle off the boundary with a change in its momentum as defined by the coefficient of restitution. (See Figure 24.23: “Reflect” Boundary Condition for the Discrete Phase (p. 1190))

trap
terminates the trajectory calculations and records the fate of the particle as “trapped”. In the case of evaporating droplets, their entire mass instantaneously passes into the vapor phase and enters the cell adjacent to the boundary. See Figure 24.24: “Trap” Boundary Condition for the Discrete Phase (p. 1191).

escape
reports the particle as having “escaped” when it encounters the boundary. Trajectory calculations are terminated. See Figure 24.25: “Escape” Boundary Condition for the Discrete Phase (p. 1191).

wall-jet
indicates that the direction and velocity of the droplet particles are given by the resulting momentum flux, which is a function of the impingement angle. See Figure 16.2: “Wall Jet” Boundary Condition for the Discrete Phase in the Theory Guide.

doom-film
consists of four regimes: stick, rebound, spread, and splash, which are based on the impact energy and wall temperature. Detailed information on the wall-film model can be found in Wall-Film Model Theory in the Theory Guide. The Number Of Splashed Drops must be specified.
user-defined

specifies a user-defined function to define the discrete phase boundary condition type.

Discrete Phase BC Function

sets the user-defined function from the drop-down list.

35.8.15. Pressure Inlet Dialog Box

The Pressure Inlet dialog box sets the boundary conditions for a pressure inlet zone. It is opened from the Boundary Conditions Task Page (p. 2102). See Inputs at Pressure Inlet Boundaries (p. 262) for details about defining the items below.

Controls

Zone Name

sets the name of the zone.

Momentum

contains the momentum parameters.
Reference Frame
specifies the reference frame for the pressure inlet. If the cell zone adjacent to the pressure inlet is moving, you can choose to specify the total temperature, total pressure, and velocity components as **Relative to Adjacent CellZone** or **Absolute** in the **Reference Frame** drop-down list.

Gauge Total Pressure
sets the gauge total (or stagnation) pressure of the inflow stream. If you are using moving reference frames, see **Defining Total Pressure and Temperature** for information about relative and absolute total pressure.

Supersonic/Initial Gauge Pressure
sets the static pressure on the boundary when the flow becomes (locally) supersonic. It is also used to compute initial values for pressure, temperature, and velocity if the pressure inlet boundary condition is selected for computing initial values (see **Initializing the Entire Flow Field Using Standard Initialization**).

Direction Specification Method
specifies the method you will use to define the flow direction. If you choose **Direction Vector**, you will define the flow direction components, and if you choose **Normal to Boundary** no inputs are required. See **Defining the Flow Direction** for information on specifying flow direction.

Coordinate System
specifies whether **Cartesian**, **Cylindrical**, **Local Cylindrical**, or **Local Cylindrical Swirl** vector components will be input. This item will appear only for 3D cases in which you have selected **Direction Vector** as the **Direction Specification Method**.

X,Y,Z-Component of Flow Direction
set the direction of the flow at the inlet boundary. These items will appear if the selected **Coordinate System** is **Cartesian** or the model is 2D non-axisymmetric.

Radial, Tangential, Axial Component of Flow Direction
set the direction of the flow at the inlet boundary. These items will appear for 2D axisymmetric cases, or for 3D cases for which the selected **Coordinate System** is **Cylindrical** or **Local Cylindrical**.

X,Y,Z-Component of Axis Direction
sets the direction of the axis. These items will appear if the selected **Coordinate System** is **Local Cylindrical**.

X,Y,Z-Coordinate of Axis Origin
sets the location of the axis origin. These items will appear if the selected **Coordinate System** is **Local Cylindrical**.

Radial-, Axial-Component of Flow Direction and Tangential-Component of Velocity
appear for a 3D **Local Cylindrical Swirl** coordinate system. Specify the X, Y, and Z-Component of **Axis Direction** and the X, Y, and Z-Coordinate of **Axis Origin**.

Turbulence
contains the turbulence parameters.

Specification Method
specifies which method will be used to input the turbulence parameters. You can choose **K and Epsilon** (k-ε models and RSM only), **K and Omega** (k-ω models only), **Intensity and Length Scale**, **Intensity and Viscosity Ratio**, **Intensity and Hydraulic Diameter**, or **Turbulent Viscosity Ratio** (Spalart-Allmaras model only). See **Determining Turbulence Parameters** for inform-
ation about the inputs for each of these methods. (This item will appear only for turbulent flow calculations.)

**Turbulent Kinetic Energy, Turbulent Dissipation Rate**
set values for the turbulence kinetic energy $k$ and its dissipation rate $\varepsilon$. These items will appear if you choose **K and Epsilon** as the Specification Method.

**Turbulent Kinetic Energy, Specific Dissipation Rate**
set values for the turbulence kinetic energy $k$ and its specific dissipation rate $\omega$. These items will appear if you choose **K and Omega** as the Specification Method.

**Turbulent Intensity, Turbulent Length Scale**
set values for turbulence intensity $I$ and turbulence length scale $\ell$. These items will appear if you choose **Intensity and Length Scale** as the Specification Method.

**Turbulent Intensity, Turbulent Viscosity Ratio**
set values for turbulence intensity $I$ and turbulent viscosity ratio $\mu_t / \mu$. These items will appear if you choose **Intensity and Viscosity Ratio** as the Specification Method.

**Turbulent Intensity, Hydraulic Diameter**
set values for turbulence intensity $I$ and hydraulic diameter $L$. These items will appear if you choose **Intensity and Hydraulic Diameter** as the Specification Method.

**Turbulent Viscosity Ratio**
sets the value of the turbulent viscosity ratio $\mu_t / \mu$. This item will appear if you choose **Turbulent Viscosity Ratio** as the Specification Method.

**Reynolds-Stress Specification Method**
specifies which method will be used to determine the Reynolds stress boundary conditions when the Reynolds stress turbulence model is used. You can choose either **K or Turbulent Intensity** or **Reynolds-Stress Components**. If you choose the former, ANSYS Fluent will compute the Reynolds stresses for you. If you choose the latter, you will explicitly specify the Reynolds stresses yourself. See Reynolds Stress Model (p. 742) for details. (This item will appear only for RSM turbulent flow calculations.)

**UU, VV, WW, UV, VW, UW Reynolds Stresses**
specify the Reynolds stress components when **Reynolds-Stress Components** is chosen as the Reynolds-Stress Specification Method.

**Thermal**
contains the thermal parameters.

**Total Temperature**
sets the total temperature of the inflow stream. If you are using moving reference frames, see Defining Total Pressure and Temperature (p. 264) for information about relative and absolute total temperature.

**Radiation**
contains the boundary conditions for the radiation model at the pressure inlet.

**External Black Body Temperature Method, Internal Emissivity**
set the radiation boundary conditions when you are using the P-1 model, the DTRM, the discrete ordinates model, or the S2S model for radiation heat transfer. See Defining Boundary Conditions for Radiation (p. 798) for details.
**Participates in Solar Ray Tracing**

specifies whether or not the pressure inlet participates in solar ray tracing.

**Solar Transmissivity Factor**

specifies a multiplier (ranging from 0 to 1) that is applied to the solar irradiation entering the domain through the pressure inlet.

**Participates in View Factor Calculation**

specifies whether or not the pressure inlet participates in the view factor calculation as part of the S2S radiation model. This parameter is available only if you select the **Surface to Surface** radiation model.

**Species**

contains the species parameters.

**Specify Species in Mole Fractions**

allows you to specify the species in mole fractions rather than mass fractions.

**Species Mass Fractions**

contains inputs for the mass fractions of defined species. See Defining Cell Zone and Boundary Conditions for Species (p. 910) for details about these inputs. (These items will appear only if you are modeling non-reacting multi-species flow or you are using the finite-rate reaction formulation.)

**Mean Mixture Fraction, Mixture Fraction Variance**

set inlet values for the PDF mixture fraction and its variance. (These items will appear only if you are using the non-premixed or partially premixed combustion model.)

**Secondary Mean Mixture Fraction, Secondary Mixture Fraction Variance**

set inlet values for the secondary mixture fraction and its variance. (These items will appear only if you are using the non-premixed or partially premixed combustion model with two mixture fractions.)

**Progress Variable**

sets the value of the progress variable for premixed turbulent combustion. See Setting Boundary Conditions for the Progress Variable (p. 1008) for details.

This item will appear only if the premixed or partially premixed combustion model is used.

**DPM**

contains the discrete phase parameters.

**Discrete Phase BC Type**

sets the way that the discrete phase behaves with respect to the boundary. This item appears when one or more injections have been defined.

- **reflect**
  
  rebounds the particle off the boundary with a change in its momentum as defined by the coefficient of restitution. (See Figure 24.23: “Reflect” Boundary Condition for the Discrete Phase (p. 1190))

- **trap**
  
  terminates the trajectory calculations and records the fate of the particle as “trapped.” In the case of evaporating droplets, their entire mass instantaneously passes into the vapor phase and enters the cell adjacent to the boundary. See Figure 24.24: “Trap” Boundary Condition for the Discrete Phase (p. 1191).
escape reports the particle as having “escaped” when it encounters the boundary. Trajectory calculations are terminated. See Figure 24.25: “Escape” Boundary Condition for the Discrete Phase (p. 1191).

wall-jet indicates that the direction and velocity of the droplet particles are given by the resulting momentum flux, which is a function of the impingement angle. See Figure 16.2: “Wall Jet” Boundary Condition for the Discrete Phase in the Theory Guide.

wall-film consists of four regimes: stick, rebound, spread, and splash, which are based on the impact energy and wall temperature. Detailed information on the wall-film model can be found in Wall-Film Model Theory in the Theory Guide. The Number Of Splashed Drops must be specified.

user-defined specifies a user-defined function to define the discrete phase boundary condition type.

Discrete Phase BC Function
sets the user-defined function from the drop-down list.

Multiphase
contains the multiphase parameters.

Granular Temperature
specifies temperature for the solids phase and is proportional to the kinetic energy of the random motion of the particles.

Volume Fraction
specifies the volume fraction of the secondary phase selected in the Boundary Conditions Task Page (p. 2102). This section of the dialog box will appear when one of the multiphase models is being used. See Defining Multiphase Cell Zone and Boundary Conditions (p. 1260) for details.

UDS
contains the UDS parameters.

User-Defined Scalar Boundary Condition
appears only if user defines scalars are specified.

User Scalar-n
specifies whether the scalar is a specified flux or a specified value.

User-Defined Scalar Boundary Value
appears only if user defines scalars are specified.

User Scalar-n
specifies the value of the scalar.

35.8.16. Pressure Outlet Dialog Box

The Pressure Outlet dialog box sets the boundary conditions for a pressure outlet zone. It is opened from the Boundary Conditions Task Page (p. 2102). See Inputs at Pressure Outlet Boundaries (p. 289) for details about defining the items below.
**Controls**

**Zone Name**
sets the name of the zone.

**Momentum**
contains the momentum parameters.

**Gauge Pressure**
sets the gauge pressure at the outflow boundary.

**Backflow Direction Specification Method**
sets the direction of the inflow stream should the flow reverse direction. If you choose **Direction Vector**, you will define the flow direction components, and if you choose **Normal to Boundary** or **From Neighboring Cell**, no inputs are required. See [Inputs at Pressure Outlet Boundaries (p. 289)](#) for information on specifying flow direction.

**Radial Equilibrium Pressure Distribution**
enables the radial equilibrium pressure distribution. See [Defining Static Pressure (p. 290)](#) for details.

This item appears only for 3D and axisymmetric swirl solvers.

**Average Pressure Specification**
allows the pressure along the outlet boundary to vary, but maintain an average equivalent to the specified value in the **Gauge Pressure** input field. In this boundary implementation, the pressure
variation provides a low level of non-reflectivity. For more details, see Calculation Procedure at Pressure Outlet Boundaries (p. 293).

**Note**

The Average Pressure Specification option is not available if the Radial Equilibrium Pressure Distribution option is enabled.

**Target Mass Flow Rate**

allows you to set mass flow rate as a boundary condition at the outlet.

**Target Mass Flow**

allows you to specify the flow as either a constant value or a UDF.

**Upper Limit of Absolute Pressure, Lower Limit of Absolute Pressure**

specifies the range of the pressure limits, which have different pressure variations on different boundaries. The upper and lower pressure limits can be specified as a constant or a profile.

**Turbulence**

contains the turbulence parameters.

**Specification Method**

specifies which method will be used to input the turbulence parameters. You can choose K and Epsilon (\(k-\varepsilon\) models and RSM only), K and Omega (\(k-\omega\) models only), Intensity and Length Scale, Intensity and Viscosity Ratio, Intensity and Hydraulic Diameter, or Turbulent Viscosity Ratio (Spalart-Allmaras model only). See Determining Turbulence Parameters (p. 257) for information about the inputs for each of these methods. (This item will appear only for turbulent flow calculations.)

**Backflow Turbulent Kinetic Energy, Backflow Turbulent Dissipation Rate**

set values for the turbulence kinetic energy \(k\) and its dissipation rate \(\varepsilon\). These items will appear if you choose K and Epsilon as the Specification Method.

**Backflow Turbulent Kinetic Energy, Backflow Specific Dissipation Rate**

set values for the turbulence kinetic energy \(k\) and its specific dissipation rate \(\omega\). These items will appear if you choose K and Omega as the Specification Method.

**Backflow Turbulent Intensity, Backflow Turbulent Length Scale**

set values for turbulence intensity \(I\) and turbulence length scale \(\ell\). These items will appear if you choose Intensity and Length Scale as the Specification Method.

**Backflow Turbulent Intensity, Backflow Turbulent Viscosity Ratio**

set values for turbulence intensity \(I\) and turbulent viscosity ratio \(\mu_t / \mu\). These items will appear if you choose Intensity and Viscosity Ratio as the Specification Method.

**Backflow Turbulent Intensity, Backflow Hydraulic Diameter**

set values for turbulence intensity \(I\) and hydraulic diameter \(L\). These items will appear if you choose Intensity and Hydraulic Diameter as the Specification Method.

**Backflow Turbulent Viscosity Ratio**

sets the value of the backflow turbulent viscosity ratio \(\mu_t / \mu\). This item will appear if you choose Turbulent Viscosity Ratio as the Specification Method.
**Reynolds-Stress Specification Method**

specifies which method will be used to determine the backflow Reynolds stress boundary conditions when the Reynolds stress turbulence model is used. You can choose either **K or Turbulent Intensity** or **Reynolds-Stress Components**. If you choose the former, ANSYS Fluent will compute the Reynolds stresses for you. If you choose the latter, you will explicitly specify the Reynolds stresses yourself. See Reynolds Stress Model (p. 742) for details. (This item will appear only for RSM turbulent flow calculations.)

**Backflow UU, VV, WW, UV, VW, UW Reynolds Stresses**

specify the backflow Reynolds stress components when **Reynolds-Stress Components** is chosen as the **Reynolds-Stress Specification Method**.

**Thermal**
contains the thermal parameters.

**Backflow Total Temperature**
sets the total temperature of the inflow stream should the flow reverse direction

**Radiation**
contains the boundary conditions for the radiation model at the pressure outlet.

**External Black Body Temperature Method, Internal Emissivity**
set the radiation boundary conditions when you are using the P-1 model, the DTRM, the discrete ordinates model, or the S2S model for radiation heat transfer. See Defining Boundary Conditions for Radiation (p. 798) for details.

**Participates in Solar Ray Tracing**
specifies whether or not the pressure outlet participates in solar ray tracing.

**Solar Transmissivity Factor**
specifies a multiplier (ranging from 0 to 1) that is applied to the solar irradiation entering the domain through the pressure outlet.

**Participates in View Factor Calculation**
specifies whether or not the pressure outlet participates in the view factor calculation as part of the S2S radiation model. This parameter is available only if you select the **Surface to Surface** radiation model.

**Species**
contains the species parameters.

**Specify Species in Mole Fractions**
alows you to specify the species in mole fractions rather than mass fractions.

**Mean Mixture Fraction, Mixture Fraction Variance**
set inlet values for the PDF mixture fraction and its variance. (These items will appear only if you are using the non-premixed or partially premixed combustion model.)

**Secondary Mean Mixture Fraction, Secondary Mixture Fraction Variance**
set inlet values for the secondary mixture fraction and its variance. (These items will appear only if you are using the non-premixed or partially premixed combustion model with two mixture fractions.)
**Species Mass Fractions**
contains inputs for the mass fractions of defined species. See Defining Cell Zone and Boundary Conditions for Species (p. 910) for details about these inputs. These items will appear only if you are modeling non-reacting multi-species flow or you are using the finite-rate reaction formulation.

**Backflow Progress Variable**
sets the value of the progress variable for premixed turbulent combustion. See Setting Boundary Conditions for the Progress Variable (p. 1008) for details.

This item will appear only if the premixed or partially premixed combustion model is used.

**DPM**
contains the discrete phase parameters.

**Discrete Phase BC Type**
sets the way that the discrete phase behaves with respect to the boundary. This item appears when one or more injections have been defined.

- **reflect**
  rebounds the particle off the boundary with a change in its momentum as defined by the coefficient of restitution. (See Figure 24.23: “Reflect” Boundary Condition for the Discrete Phase (p. 1190))

- **trap**
  terminates the trajectory calculations and records the fate of the particle as “trapped”. In the case of evaporating droplets, their entire mass instantaneously passes into the vapor phase and enters the cell adjacent to the boundary. See Figure 24.24: “Trap” Boundary Condition for the Discrete Phase (p. 1191).

- **escape**
  reports the particle as having “escaped” when it encounters the boundary. Trajectory calculations are terminated. See Figure 24.25: “Escape” Boundary Condition for the Discrete Phase (p. 1191).

- **wall-jet**
  indicates that the direction and velocity of the droplet particles are given by the resulting momentum flux, which is a function of the impingement angle. See Figure 16.2: “Wall Jet” Boundary Condition for the Discrete Phase in the Theory Guide.

- **wall-film**
  consists of four regimes: stick, rebound, spread, and splash, which are based on the impact energy and wall temperature. Detailed information on the wall-film model can be found in Wall-Film Model Theory the Theory Guide. The Number Of Splashed Drops must be specified.

- **user-defined**
  specifies a user-defined function to define the discrete phase boundary condition type.

**Discrete Phase BC Function**
sets the user-defined function from the drop-down list.

**Multiphase**
contains the multiphase parameters.

**Backflow Granular Temperature**
specifies temperature for the solids phase and is proportional to the kinetic energy of the random motion of the particles.
**Backflow Volume Fraction**
specifies the volume fraction of the secondary phase selected in the [Boundary Conditions Task Page](p. 2102). This section of the dialog box will appear when one of the multiphase models is being used. See [Defining Multiphase Cell Zone and Boundary Conditions](p. 1260) for details.

**UDS** contains the UDS parameters.

**User-Defined Scalar Boundary Condition** appears only if user defines scalars are specified.

**User Scalar-n**
specifies whether the scalar is a specified flux or a specified value.

**User-Defined Scalar Boundary Value** appears only if user defines scalars are specified.

**User Scalar-n** specifies the value of the scalar.

### 35.8.17. Radiator Dialog Box

The **Radiator** dialog box sets the boundary conditions for a radiator model zone. It is opened from the [Boundary Conditions Task Page](p. 2102). See [User Inputs for Radiators](p. 344) for details about the items below.

![Radiator Dialog Box](image)

**Controls**

**Zone Name**
sets the name of the zone.

**Loss Coefficient**
specifies the loss coefficient as a constant value or as a polynomial, piecewise-linear, or piecewise-polynomial function of velocity. See [Defining the Pressure Loss Coefficient Function](p. 345) for details.
Heat-Transfer-Coefficient
specifies the heat-transfer coefficient as a constant value or as a polynomial, piecewise-linear, or piecewise-polynomial function of velocity. See Defining the Heat Flux Parameters (p. 348) for details.

Temperature
sets the temperature used to compute heat flux from the radiator using the Heat-Transfer-Coefficient. If Temperature is absolute zero, the Heat Flux condition is used instead.

Heat Flux
sets the heat flux at the radiator surface (used only when Temperature is absolute zero).

Discrete Phase BC Type
sets the way that the discrete phase behaves with respect to the boundary. This item appears when one or more injections have been defined.

interior
allows the particles to pass through the boundary.

reflect
rebounds the particle off the boundary with a change in its momentum as defined by the coefficient of restitution. (See Figure 24.23: “Reflect” Boundary Condition for the Discrete Phase (p. 1190))

trap
terminates the trajectory calculations and records the fate of the particle as “trapped”. In the case of evaporating droplets, their entire mass instantaneously passes into the vapor phase and enters the cell adjacent to the boundary. See Figure 24.24: “Trap” Boundary Condition for the Discrete Phase (p. 1191).

escape
reports the particle as having “escaped” when it encounters the boundary. Trajectory calculations are terminated. See Figure 24.25: “Escape” Boundary Condition for the Discrete Phase (p. 1191).

wall-jet
indicates that the direction and velocity of the droplet particles are given by the resulting momentum flux, which is a function of the impingement angle. See Figure 16.2: “Wall Jet” Boundary Condition for the Discrete Phase in the Theory Guide.

wall-film
consists of four regimes: stick, rebound, spread, and splash, which are based on the impact energy and wall temperature. Detailed information on the wall-film model can be found in Wall-Film Model Theory in the Theory Guide. The Number Of Splashed Drops must be specified.

user-defined
specifies a user-defined function to define the discrete phase boundary condition type.

Discrete Phase BC Function
sets the user-defined function from the drop-down list.

35.8.18. RANS/LES Interface Dialog Box

The RANS/LES Interface dialog box can be used to create artificial resolved turbulence (fluctuation/perturbations) at the interface where the flow proceeds from the RANS zone into the LES zone of the computational domain for Embedded LES turbulent flows. It is opened from the Boundary Conditions...
Task Page (p. 2102). See Setting Up the Embedded Large Eddy Simulation (ELES) Model (p. 731) for more information about RANS/LES interfaces.

**Controls**

**Zone Name**
sets the name of the RANS/LES interface.

**Fluctuating Velocity Algorithm**
displays the methods for generating fluctuating velocity components at the RANS/LES interface. Available options include:

- No Perturbations
- Spectral Synthesizer
- Vortex Method

**Number of Vortices**
displays the amount of vortices that the selected fluctuating velocity method distributes randomly over the face zone and uses to generate turbulent fluctuations (available for the Vortex Method only).

---

**Important**

The RANS/LES 'interface' can either be an interior zone (that has been assigned to be a rans-les-interface zone), or it can be a non-conformal interface. If it is a non-conformal interface, the you need to identify the name of the non-conformal interface's "interior" zone (for example, using the Mesh Interfaces task page), and then go to that zone in the **Boundary Conditions** task page.

---

**35.8.19. Symmetry Dialog Box**

The **Symmetry** dialog box can be used to modify the name of a symmetry zone; there are no conditions to be set. It is opened from the **Boundary Conditions Task Page (p. 2102)**. See **Symmetry Boundary Conditions (p. 330)** for information about symmetry boundaries.
**Controls**

**Zone Name**
sets the name of the zone.

**Phase**
displays the name of the phase. This item is available only for multiphase flows.

### 35.8.20. Velocity Inlet Dialog Box

The **Velocity Inlet** dialog box sets the boundary conditions for a velocity inlet zone. It is opened from the **Boundary Conditions Task Page (p. 2102)**. See **Inputs at Velocity Inlet Boundaries (p. 271)** for details about defining the items below.

**Controls**
Zone Name
sets the name of the zone.

Phase
displays the name of the phase. This item appears if the VOF, mixture, or Eulerian multiphase model is being used.

Open Channel Wave BC
allows you to set specific parameters for a particular boundary for open channel wave boundaries. This is available when the volume of fluid multiphase model is selected.

Momentum
contains the momentum parameters.

Velocity Specification Method
sets the method used to define the inflow velocity.

Flow Direction Specification Method
sets the method used to define the direction of flow of the wave. This is available when you enable the Open Channel Wave BC option.

Magnitude and Direction
allows specification in terms of a Velocity Magnitude and Flow-Direction.

Components
allows specification in terms of the Cartesian, cylindrical, or local cylindrical velocity components.

Magnitude, Normal to Boundary
allows specification of a Velocity Magnitude normal to the boundary.

Reference Frame
specifies relative or absolute velocity inputs. You can choose to enter Absolute velocities or velocities Relative to Adjacent Cell Zone. If you are not using moving reference frames, both options are equivalent, so you need not choose.

Uniform Flow Velocity Magnitude
is the flow velocity, specified as a constant or a parameter.

Coordinate System
specifies whether Cartesian, Cylindrical, or Local Cylindrical velocities will be input. This item will appear only for 3D cases in which you have selected Magnitude and Direction or Components as the Velocity Specification Method.

X,Y,Z-Velocity
set the components of the velocity vector at the inflow boundary. These items will appear for 2D non-axisymmetric models, or for 3D models if you select the Components option as the Velocity Specification Method and Cartesian as the Coordinate System.

Radial, Tangential, Axial-Velocity
set the components of the velocity vector at the inflow boundary. These items will appear for 3D models if you select the Components option as the Velocity Specification Method and Cylindrical or Local Cylindrical as the Coordinate System.
Axial, Radial, Swirl-Velocity
set the components of the velocity vector at the inflow boundary. These items will appear for 2D axisymmetric models.

Important
Swirl-Velocity will appear only for 2D axisymmetric swirl models.

Angular Velocity
specifies the angular velocity \( \Omega \) for a 3D flow. This item will appear for a 3D model if you select the Components option as the Velocity Specification Method and Cylindrical or Local Cylindrical as the Coordinate System.

Swirl Angular Velocity
specifies the swirl angular velocity \( \Omega \) for an axisymmetric swirling flow. This item will appear for an axisymmetric swirl model if you choose Components as the Velocity Specification Method.

Velocity Magnitude
sets the magnitude of the velocity vector at the inflow boundary. This item will appear if you select the Magnitude and Direction or Magnitude, Normal to Boundary option as the Velocity Specification Method.

X,Y,Z-Component of Flow-Direction
set the direction of the velocity vector at the inflow boundary. These items will appear for 2D non-axisymmetric models if you select the Magnitude and Direction option as the Velocity Specification Method, or for 3D models if you select the Magnitude and Direction option as the Velocity Specification Method and Cartesian as the Coordinate System.

Radial, Tangential, Axial-Component of Flow Direction
set the direction of the velocity vector at the inlet boundary. These items will appear for 3D models if you select the Magnitude and Direction option as the Velocity Specification Method and Cylindrical or Local Cylindrical as the Coordinate System, or for 2D axisymmetric models.

Important
Tangential-Velocity will appear only for 2D axisymmetric swirl models.

X,Y,Z-Component of Axis Direction
sets the direction of the axis. These items will appear if the selected Coordinate System is Local Cylindrical.

X,Y,Z-Coordinate of Axis Origin
sets the location of the axis origin. These items will appear if the selected Coordinate System is Local Cylindrical.

Outflow Gauge Pressure
specifies the pressure to be used as the pressure outlet condition if flow exits the domain at any face on the velocity inlet boundary. (Note that this effect is similar to that of the “velocity far-field” boundary that was available in RAMPANT 3.)

This item appears only for the density-based solvers.
Turbulence contains the turbulence parameters.

**Specification Method**
specifies which method will be used to input the turbulence parameters. You can choose **K and Epsilon** ($k-\varepsilon$ models and RSM only), **K and Omega** ($k-\omega$ models only), **Intensity and Length Scale**, **Intensity and Viscosity Ratio**, **Intensity and Hydraulic Diameter**, or **Turbulent Viscosity Ratio** (Spalart-Allmaras model only). See Determining Turbulence Parameters (p. 257) for information about the inputs for each of these methods. (This item will appear only for turbulent flow calculations.)

**Turbulent Kinetic Energy, Turbulent Dissipation Rate**
set values for the turbulence kinetic energy $k$ and its dissipation rate $\varepsilon$. These items will appear if you choose **K and Epsilon** as the **Specification Method**.

**Turbulent Kinetic Energy, Specific Dissipation Rate**
set values for the turbulence kinetic energy $k$ and its specific dissipation rate $\omega$. These items will appear if you choose **K and Omega** as the **Specification Method**.

**Turbulent Intensity, Turbulent Length Scale**
set values for turbulence intensity $I$ and turbulence length scale $\ell$. These items will appear if you choose **Intensity and Length Scale** as the **Specification Method**.

**Turbulent Intensity, Turbulent Viscosity Ratio**
set values for turbulence intensity $I$ and turbulent viscosity ratio $\mu_t/\mu$. These items will appear if you choose **Intensity and Viscosity Ratio** as the **Specification Method**.

**Turbulent Intensity, Hydraulic Diameter**
set values for turbulence intensity $I$ and hydraulic diameter $L$. These items will appear if you choose **Intensity and Hydraulic Diameter** as the **Specification Method**.

**Turbulent Viscosity Ratio**
sets the value of the turbulent viscosity ratio $\mu_t/\mu$. This item will appear if you choose **Turbulent Viscosity Ratio** as the **Specification Method**.

**Turbulent Intensity**
sets the value of the turbulence intensity $I$ for the LES model.

**Reynolds-Stress Specification Method**
specifies which method will be used to determine the Reynolds stress boundary conditions when the Reynolds stress turbulence model is used. You can choose either **K or Turbulent Intensity** or **Reynolds-Stress Components**. If you choose the former, ANSYS Fluent will compute the Reynolds stresses for you. If you choose the latter, you will explicitly specify the Reynolds stresses yourself. See Reynolds Stress Model (p. 742) for details. (This item will appear only for RSM turbulent flow calculations.)

**UU, VV, WW, UV, VW, UW Reynolds Stresses**
specify the Reynolds stress components when **Reynolds-Stress Components** is chosen as the **Reynolds-Stress Specification Method**.

Thermal contains the thermal parameters.
**Temperature**
specifies the static temperature of the flow.

**Radiation**
contains the boundary conditions for the radiation model at the velocity inlet.

**External Black Body Temperature Method, Internal Emissivity**
set the radiation boundary conditions when you are using the P-1 model, the DTRM, the discrete ordinates model, or the S2S model for radiation heat transfer. See *Defining Boundary Conditions for Radiation* (p. 798) for details.

**Participates in Solar Ray Tracing**
specifies whether or not the velocity inlet participates in solar ray tracing.

**Solar Transmissivity Factor**
specifies a multiplier (ranging from 0 to 1) that is applied to the solar irradiation entering the domain through the velocity inlet.

**Participates in View Factor Calculation**
specifies whether or not the velocity inlet participates in the view factor calculation as part of the S2S radiation model. This parameter is available only if you select the *Surface to Surface* radiation model.

**Species**
contains the species parameters.

**Specify Species in Mole Fractions**
allows you to specify the species in mole fractions rather than mass fractions.

**Species Mass Fractions**
contains inputs for the mass fractions of defined species. See *Defining Cell Zone and Boundary Conditions for Species* (p. 910) for details about these inputs. These items will appear only if you are modeling non-reacting multi-species flow or you are using the finite-rate reaction formulation.

**Mean Mixture Fraction, Mixture Fraction Variance**
set inlet values for the PDF mixture fraction and its variance. These items will appear only if you are using the non-premixed or partially premixed combustion model.

**Secondary Mean Mixture Fraction, Secondary Mixture Fraction Variance**
set inlet values for the secondary mixture fraction and its variance. (These items will appear only if you are using the non-premixed or partially premixed combustion model with two mixture fractions.)

**Progress Variable**
sets the value of the progress variable for premixed turbulent combustion. See *Setting Boundary Conditions for the Progress Variable* (p. 1008) for details.

This item will appear only if the premixed or partially premixed combustion model is used.

**DPM**
contains the discrete phase parameters.

**Discrete Phase BC Type**
sets the way that the discrete phase behaves with respect to the boundary. This item appears when one or more injections have been defined.
reflect
rebounds the particle off the boundary with a change in its momentum as defined by the coefficient of restitution. (See Figure 24.23: “Reflect” Boundary Condition for the Discrete Phase (p. 1190))

trap
terminates the trajectory calculations and records the fate of the particle as “trapped”. In the case of evaporating droplets, their entire mass instantaneously passes into the vapor phase and enters the cell adjacent to the boundary. See Figure 24.24: “Trap” Boundary Condition for the Discrete Phase (p. 1191).

escape
reports the particle as having “escaped” when it encounters the boundary. Trajectory calculations are terminated. See Figure 24.25: “Escape” Boundary Condition for the Discrete Phase (p. 1191).

wall-jet
indicates that the direction and velocity of the droplet particles are given by the resulting momentum flux, which is a function of the impingement angle. See Figure 16.2: “Wall Jet” Boundary Condition for the Discrete Phase in the Theory Guide.

wall-film
consists of four regimes: stick, rebound, spread, and splash, which are based on the impact energy and wall temperature. Detailed information on the wall-film model can be found in Wall-Film Model Theory in the Theory Guide. The Number Of Splashed Drops must be specified.

user-defined
specifies a user-defined function to define the discrete phase boundary condition type.

Discrete Phase BC Function
sets the user-defined function from the drop-down list.

Multiphase
contains the multiphase parameters.

Volume Fraction
specifies the volume fraction of the secondary phase selected in the Boundary Conditions Task Page (p. 2102). This section of the dialog box will appear when one of the multiphase models is being used. See Defining Multiphase Cell Zone and Boundary Conditions (p. 1260) for details.

Wave Theory
allows you to choose from First Order Airy (the default), Second Order Stokes, Third Order Stokes, Fourth Order Stokes, and Fifth Order Stokes. Information about the types of wave theory is available in Open Channel Wave Boundary Conditions in the Theory Guide.

Wave BC Options
allows you to choose between Shallow/Intermediate Waves or Short Gravity Waves. Information about the two types of waves is available in Backflow Volume Fraction Specification in the Theory Guide.

Secondary Phase for Inlet
is where the specified parameters are valid only for one secondary phase. In case of a three-phase flow, select the corresponding secondary phase from this list.

Wave Amplitude
is the amplitude of the shallow wave or short gravity wave.
Wave Length
is the wave length of the shallow wave or short gravity wave.

Free Surface Level
can be determined using the absolute value of height from the free surface to the origin in the direction of gravity, or by applying the correct sign based on whether the free surface level is above or below the origin.

Bottom Level
is valid only for shallow waves. The bottom level is used for calculating the liquid height.

Phase Difference
is the phase difference between one wave and another.

UDS
contains the UDS parameters.

User-Defined Scalar Boundary Condition
appears only if user defines scalars are specified.

User Scalar-n
specifies whether the scalar is a specified flux or a specified value.

User-Defined Scalar Boundary Value
appears only if user defines scalars are specified.

User Scalar-n
specifies the value of the scalar.

35.8.21. Wall Dialog Box

The Wall dialog box sets the boundary conditions for a wall zone. It is opened from the Boundary Conditions Task Page (p. 2102). See Inputs at Wall Boundaries (p. 309) for details about defining the items below.
Controls

Zone Name
sets the name of the zone.

Phase
displays the name of the phase. This item appears if the VOF, mixture, or Eulerian multiphase model is being used.

Adjacent Cell Zone
shows the name of the cell zone adjacent to the wall. (This is for informational use only; you cannot edit this field.)

Momentum
displays the momentum boundary conditions.
Wall Motion
contains options for specifying whether or not the wall is moving.

Stationary Wall
specifies that the wall is not moving relative to the adjacent cell zone.

Moving Wall
enables specification of the tangential wall motion. Tangential wall motion is applicable only to
viscous flows. Since the inviscid slip condition decouples the tangential wall velocity from the
governing equations, tangential wall motion has no effect on inviscid flow.

Motion
contains inputs related to wall motion. See Velocity Conditions for Moving Walls (p. 311) for details.

Relative to Adjacent Cell Zone
enables the specification of a wall velocity relative to the velocity of the adjacent cell zone. (If
the adjacent cell zone is not moving, this is equivalent to Absolute.)

Absolute
enables the specification of an absolute wall velocity,

Translational
enables the specification of a translational wall velocity.

Rotational
enables the specification of a rotational wall velocity.

Components
enables the specification of wall velocity components.

Speed
sets the translational or rotational speed of the wall (depending on whether you selected
Translational or Rotational).

Direction
sets the direction vector of the translational velocity. (This item will appear if you have chosen the
Translational option.)

Rotation-Axis Origin
sets the coordinates of the origin of the axis of rotation, thereby determining the location of the
axis. (This item will appear if you have chosen the Rotational option for a non-axisymmetric case.)

Rotation-Axis Direction
sets the direction vector for the axis of rotation. (This item will appear if you have chosen the
Rotational option for a non-axisymmetric case.)

Velocity Components
sets the X, Y, and Z-Velocity components of the wall motion. (This item will appear if you have
chosen the Components option.)

Shear Condition
contains options for specifying the shear conditions at the wall.
**No Slip**
specifies a no-slip condition at the wall. No further inputs are required.

**Specified Shear**
enables specification of zero or non-zero shear. See Specified Shear (p. 313) for details. This option is not available for moving walls.

**Marangoni Stress**
enables the specification of shear stress caused by the variation of surface tension due to temperature. This option is not available for moving walls.

**Shear Stress**
contains inputs related to wall shear. These items will appear when Specified Shear is selected as the Shear Condition. See Specified Shear (p. 313) for details.

**X-Component, Y-Component, Z-Component, Swirl Component**
specify the \(x\), \(y\), and \(z\) or swirl components of shear for a slip wall. Swirl Component is available only for axisymmetric swirl cases.

**Specularity Coefficient**
is used in multiphase granular flow. You can specify the specularity coefficient such that when the value is zero, this condition is equivalent to zero shear at the wall, but when the value is near unity, there is a significant amount of lateral momentum transfer.

**Specularity Coefficient** allows you to enter a value between zero and one, which controls the amount of lateral momentum transfer.

**Marangoni Stress**
contains inputs related to Marangoni stress. This item will appear when Marangoni Stress is selected as the Shear Condition. See Marangoni Stress (p. 314) for details.

**Surface Tension Gradient**
specifies the surface tension gradient with respect to temperature (\(d\sigma/dT\) in Equation 6.87 (p. 314)).

**Wall Roughness**
contains inputs for defining wall roughness in turbulent calculations. See Wall Roughness Effects in Turbulent Wall-Bounded Flows (p. 315) for details.

**Roughness Height**
sets the roughness height \(K_s\) (see Setting the Roughness Parameters (p. 317) for details).

**Roughness Constant**
sets the roughness constant \(C_{K_s}\) (see Setting the Roughness Parameters (p. 317) for details).

**Wall Adhesion**
contains inputs related to wall adhesion. This section of the dialog box will appear if you are using the VOF model and have enabled wall adhesion in the e Phase Interaction Dialog Box (p. 2079).
**Contact Angles**

specifies the contact angle at the wall for each pair of phases ($\theta_w$ in Figure 25.26: Measuring the Contact Angle (p. 1302) in the Theory Guide). See Steps for Setting Boundary Conditions (p. 1269) for details.

**Thermal**

contains the thermal parameters. This tab is available only when the energy equation is turned on.

**Thermal Conditions**

contains radio buttons for selecting the thermal boundary condition type. See Thermal Boundary Conditions at Walls (p. 318) for details about these inputs:

- **Heat Flux**
  
  selects a specified heat flux condition.

- **Temperature**
  
  selects a specified wall temperature condition.

- **Convection**
  
  selects a convective heat transfer boundary condition model.

- **Radiation**
  
  selects an external radiation boundary condition.

- **Mixed**
  
  selects a combined convection/external radiation boundary condition.

- **Coupled**
  
  selects a coupled heat transfer condition. It is applicable only to walls that form the interface between two regions (such as the fluid/solid interface for a conjugate heat transfer problem).

- **via System Coupling**
  
  selects a heat transfer condition where a boundary can receive thermal data (either wall temperature or heat flow) from the System Coupling service. It is applicable when ANSYS Fluent is coupled with another system in Workbench using System Coupling (see Heat Transfer Boundary Conditions Through System Coupling (p. 324) for details).

Once a condition type has been selected, the appropriate conditions can be specified.

- **Heat Flux**
  
  sets the wall heat flux to be used for the Heat Flux condition. A specification of zero Heat Flux is simply the adiabatic condition (no heat transfer). A positive value of heat flux implies that heat is input into the domain.

- **Temperature**
  
  sets the wall temperature to be used for the Temperature condition.

- **Heat Transfer Coefficient**
  
  sets the convective heat transfer coefficient to be used for the Convection condition ($h_{eff}$ in Equation 6.99 (p. 329)).

- **Free Stream Temperature**
  
  sets the reference or free stream temperature to be used for the Convection condition ($T_{ext}$ in Equation 6.99 (p. 329)).
External Emissivity
sets the emissivity of the external wall to be used for the Radiation condition ($\varepsilon_{\text{ext}}$ in Equation 6.100 (p. 329)).

External Radiation Temperature
sets the temperature of the external radiation source/sink to be used for the Radiation condition ($T_{\text{oe}}$ in Equation 6.100 (p. 329)).

Internal Emissivity
sets the internal emissivity of the wall. This item will appear only if you are using the gray P-1 model, the DTRM, the gray discrete ordinates model, or the S2S model for radiation heat transfer. (Note that it will not appear if you are using the non-gray P-1 model or the non-gray discrete ordinates model. In these cases, you will enter the Internal Emissivity for each band in the Radiation tab.)

Wall Thickness
sets the thickness of a thin wall for the calculation of thermal resistance. (See Thin-Wall Thermal Resistance Parameters (p. 320) for details.)

Heat Generation Rate
sets the rate of heat generation in a wall without shell conduction.

Contact Resistance
sets the contact resistance ($R_{\text{c}}$ in Equation 18.23 in the Theory Guide) at the wall. See Modeling Solidification and Melting (p. 1389) for details. This item appears only when the solidification/melting model is used.

Material Name
sets the material type for a thin wall. The conductivity of the material is used for the calculation of thin-wall thermal resistance. (See Thin-Wall Thermal Resistance Parameters (p. 320) for details.) Material is used only when Wall Thickness is non-zero. Materials are defined with the Materials Task Page (p. 2020).

Shell Conduction
enables shell conduction for the wall. See Shell Conduction (p. 323) for details.

Define...
is only available when Shell Conduction is enabled, and opens the Shell Conduction Model Settings Dialog Box (p. 2447) in order to allow you to define the shell conduction settings for the wall.

Radiation
displays the boundary conditions for the S2S model, the DO model, and the non-gray P-1 model at the wall. This tab is only available if you are using the surface to surface model, the discrete ordinates model, or the non-gray P-1 model. See Forming Surface Clusters (p. 784), Wall Boundary Conditions for the DO Model (p. 800), and Wall Boundary Conditions for the DTRM, and the P-1, S2S, and Rosseland Models (p. 800) for details.

BC Type
contains a drop-down list of available radiation boundary condition types. The available options are opaque and semi-transparent. This item will appear only if you are using the discrete ordinates model.
Internal Emissivity
specifies the internal emissivity of the wall in each wavelength band. This item will appear only if you are using the non-gray discrete ordinates model and you have selected **opaque** as the **BC Type**, or if you are using the non-gray P-1 model.

Diffuse Fraction
specifies the fraction of the irradiation that is to be treated as diffuse. By default, the **Diffuse Fraction** is set to 1, indicating that all of the irradiation is diffuse. If the non-gray DO model is being used, the **Diffuse Fraction** can be specified for each band. This item will appear only if you are using the discrete ordinates model.

Beam Width
specifies the beam width for an external semi-transparent wall in terms of the **Theta** and **Phi** extents. This item will appear only if you are using the discrete ordinates radiation model and you have selected **semi-transparent** as the **BC Type**.

Beam Direction
specifies the beam direction as an **X,Y,Z** vector. You can specify the **Beam Direction** as a constant, a profile, or a UDF. This item will appear only if you are using the discrete ordinates radiation model and you have selected **semi-transparent** as the **BC Type**.

Direct Irradiation
specifies the value of the irradiation flux. If the non-gray DO model is being used, a constant **Direct Irradiation** can be specified for each band.

Apply Direct Irradiation Parallel to the Beam
is the default means of specifying the scale of irradiation flux. When enabled, ANSYS Fluent assumes that the value of **Direct Irradiation** that you specify is the irradiation flux parallel to the **Beam Direction**. When deselected, ANSYS Fluent instead assumes that the value specified is the flux parallel to the face normals and will calculate the resulting beam parallel flux for every face. This item will appear only if you are using the discrete ordinates model.

Diffuse Irradiation
specifies the value of the irradiation flux. If the non-gray DO model is being used, a constant **Diffuse Irradiation** can be specified for each band.

Solar Boundary Conditions
contains the settings for solar ray tracing. This group box is available only if you select **Solar Ray Tracing** from the **Model list in the Solar Load** group box of the **Radiation Model** dialog box. See **Solar Ray Tracing (p. 829)** for details.

Participates in Solar Ray Tracing
specifies whether or not the wall participates in solar ray tracing.

Absorptivity
contains the settings that define the absorptivity of wall.
**Direct Visible**
specifies a multiplier (ranging from 0 to 1) that is applied to the visible portion of the direct solar radiation spectrum to account for the absorption of the wall. The value should be defined for normal incident rays.

**Direct IR**
specifies a multiplier (ranging from 0 to 1) that is applied to the infrared portion of the direct solar radiation spectrum to account for the absorption of the wall. The value should be defined for normal incident rays.

**Diffuse Hemispherical**
specifies a multiplier (ranging from 0 to 1) that is applied to the diffuse solar radiation to account for the absorption of the wall. This setting is only available for semi-transparent walls.

**Transmissivity**
contains the settings that define the transmissivity of the wall. This group box is only available when *semi-transparent* is selected for **BC Type**.

**Direct Visible**
specifies a multiplier (ranging from 0 to 1) that is applied to the visible portion of the direct solar radiation spectrum to account for the transmissivity of the wall. This setting is only available for semi-transparent walls.

**Direct IR**
specifies a multiplier (ranging from 0 to 1) that is applied to the infrared portion of the direct solar radiation spectrum to account for the transmissivity of the wall. This setting is only available for semi-transparent walls.

**Diffuse Hemispherical**
specifies a multiplier (ranging from 0 to 1) that is applied to the diffuse solar radiation to account for the transmissivity of the wall. This setting is only available for semi-transparent walls.

**S2S Parameters**
contains the settings for the S2S radiation model. This group box is available only if you select the **Surface to Surface** radiation model. See **Forming Surface Clusters** (p. 784) for details.

**Faces Per Surface Cluster**
sets the number of faces per surface cluster (FPSC) for the wall, and thus controls the number of radiating surfaces and (if you select **Cluster to Cluster** for Basis in the **View Factors and Clustering** dialog box) view factor surfaces.

**Critical Zone**
specifies that the wall is a critical zone. When this option is enabled, the value entered for **Faces Per Surface Cluster** will not be altered when you use **Automatic** clustering in the **View Factors and Clustering** dialog box, and impacts the calculations and actions performed by the buttons in the **Maximum Distance from Critical Zone** group box of the **Participating Boundary Zones** dialog box.

**Participates in View Factor Calculation**
specifies whether or not the wall participates in the view factor calculation as part of the S2S radiation model. This option is available only if you select the **Surface to Surface** radiation model.
Species
contains the species parameters. This tab is available only if you have enabled the Species Transport model in the Species Model Dialog Box (p. 1943).

Reaction
activates reactions at the wall. This item will appear only if you have enabled any of the reactions in the Species Model Dialog Box (p. 1943).

Reaction Mechanisms
allows you to specify a defined group, or mechanism, of available reactions. This item will appear only if the Reaction option has been turned on. See Defining Zone-Based Reaction Mechanisms (p. 904) for details about defining reaction mechanisms.

Surface Area Washcoat Factor
allows you to specify a factor, which multiplies the wall area to account for the increased surface area of washcoats. This item will appear only if the Reaction option has been turned on. See Species Boundary Conditions for Walls (p. 325) for details.

Species Boundary Condition
contains options for the specification of species boundary conditions. See Species Boundary Conditions for Walls (p. 325) for details.

Zero Diffusive Flux
indicates a zero-flux condition for a species. This is the default condition.

Specified Mass Fraction
indicates that the species mass fraction will be specified.

Species Mass Fractions
contains inputs for the species mass fractions of any species for which you have selected Species Mass Fraction as the Species Boundary Condition.

DPM
contains the discrete phase parameters. This tab is available only if you have defined at least one injection.

Discrete Phase Model Conditions
contains inputs for setting the fate of particle trajectories at the wall. These options will appear when one or more injections have been defined. See Setting Boundary Conditions for the Discrete Phase (p. 1189) for details.

Boundary Cond. Type
sets the way that the discrete phase behaves with respect to the boundary.

reflect
rebounds the particle off the boundary with a change in its momentum as defined by the coefficients of restitution. (See Figure 24.23: “Reflect” Boundary Condition for the Discrete Phase (p. 1190))

trap
terminates the trajectory calculations and records the fate of the particle as “trapped”. In the case of evaporating droplets, their entire mass instantaneously passes into the vapor phase and enters the cell adjacent to the boundary. See Figure 24.24: “Trap” Boundary Condition for the Discrete Phase (p. 1191).
escape reports the particle as having “escaped” when it encounters the boundary. Trajectory calculations are terminated. See Figure 24.25: “Escape” Boundary Condition for the Discrete Phase (p. 1191).

user-defined specifies a user-defined function to define the discrete phase boundary condition type.

Boundary Cond. Function sets the user-defined function from the drop-down list.

Discrete Phase Reflection Coefficients determine the behavior of reflecting particles. This item appears when reflect is chosen as the Boundary Cond. Type. See Discrete Phase Boundary Condition Types (p. 1189) for details on setting the following items.

Normal sets the type of function for the normal coefficient of restitution. This function can be constant, piecewise-linear, piecewise-polynomial, or polynomial.

Tangent sets the type of function for the tangential coefficient of restitution. This function can be constant, piecewise-linear, piecewise-polynomial, or polynomial.

DEM Collision Partner contains a list of names to designate the collision partner.

Erosion Model contains inputs for erosion calculations. See Discrete Phase Boundary Condition Types (p. 1189) for details about these items.

Diameter Function specifies the value of $C(d_p)$ in Equation 16.213 in the Theory Guide.

Velocity Exponent Function specifies the value of $b(v)$ in Equation 16.213 in the Theory Guide.

UDS displays the boundary conditions for user-defined scalars (UDSs) at the wall. This tab is available only if you have specified a non-zero number of user-defined scalars in the User-Defined Scalars Dialog Box (p. 2456).

User Defined Scalar Boundary Condition contains options for the specification of UDS boundary conditions. See the separate UDF Manual for details.

Specified Flux indicates that the flux of the UDS at the wall will be specified.
**Specified Value**
indicates that the value for the UDS at the wall will be specified.

**User Defined Scalar Boundary Value**
contains inputs for the value of the flux of the UDS, or the value of the UDS itself, depending on your selection for that UDS under **User Defined Scalar Boundary Condition**.

**Wall Film**
displays the boundary conditions for liquid films at the wall. This tab is available only if you have enabled the Eulerian Wall Film model in the **Models Task Page (p. 1896)**.

**Eulerian Film Wall**
allows you to define a film wall condition for any wall. See **Modeling Eulerian Wall Films (p. 1397)** for details. Once this option is enabled, you can set the following:

**Boundary Condition**
Film boundary condition values:

**Film Mass Flux**
The film mass source in terms of mass flux per unit area (kg/m$^2$–s).

**X-Momentum Flux, Y-Momentum Flux, and Z-Momentum Flux**
The film momentum source in terms of momentum flux per unit area (N/m$^2$).

**Incoming Film Temperature**
The film temperature (K).

**Initial Condition**
Initial film conditions:

**Film Height**
The film height at the wall boundary.

**X-Velocity, Y-Velocity, and Z-Velocity**
The film velocity components at the wall boundary.

**Film Temperature**
The film temperature (K).

**Flow Momentum Coupling**
When this option is selected, the liquid film and the gas flow will share the same velocity at the interface of the liquid-gas interface using a two-way coupling. When this option is not selected, the coupling between the liquid film and the gas flow is only one-way, namely, while the gas flow impacts the film flow, the film flow does not impact the bulk of the gas flow.

### 35.8.22. Periodic Conditions Dialog Box

The **Periodic Conditions** dialog box allows you to set parameters that define fully-developed periodic flow and heat transfer. See **User Inputs for the Pressure-Based Solver (p. 515)** and **Using Periodic Heat Transfer (p. 843)** for details.

(This dialog box is available only when the pressure-based solver is used; it is not available for the density-based coupled solvers.)
### Controls

**Specify Mass Flow**

enables the specification of the mass flow rate.

**Specify Pressure Gradient**

enables the specification of the pressure gradient.

**Mass Flow Rate**

specifies the mass flow rate. This item will not be available if you selected the **Specify Pressure Gradient** option.

---

**Important**

For axisymmetric problems, the mass flow rate is per $2\pi$ radians.

---

**Pressure Gradient**

specifies the pressure gradient ($\beta$ in Equation 1.22 in the Theory Guide).

**Upstream Bulk Temperature**

sets the inlet bulk temperature for periodic heat transfer calculations.

**Flow Direction**

sets the direction of the periodic flow. The direction vector must be parallel to the periodic translation direction or its opposite.

**Relaxation Factor**

sets the under-relaxation factor that controls convergence of the iteration process described in Setting Parameters for the Calculation of $\beta$ (p. 517) for specified mass flow.

**Number of Iterations**

sets the number of subiterations done on the correction of $\beta$ in the pressure correction equation for specified mass flow. See Setting Parameters for the Calculation of $\beta$ (p. 517) for details.
Update updates the Pressure Gradient field with the current value.

35.9. Mesh Interfaces Task Page

The Mesh Interfaces task page allows you to define the parameters for any mesh interfaces in your model.

<table>
<thead>
<tr>
<th>Mesh Interfaces</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mesh Interfaces</td>
</tr>
<tr>
<td>interface-rotor-stator</td>
</tr>
</tbody>
</table>

Create/Edit... displays the Create/Edit Mesh Interfaces Dialog Box (p. 2172).

Preview Mesh Motion... displays the Mesh Motion Dialog Box (p. 2200).

For additional information, see the following section:
35.9.1. Create/Edit Mesh Interfaces Dialog Box

35.9.1. Create/Edit Mesh Interfaces Dialog Box

The Create/Edit Mesh Interfaces dialog box allows you to define mesh interfaces for use with sliding meshes (see Using Sliding Meshes (p. 565)) or multiple reference frames (see Mesh Setup for a Multiple Moving Reference Frame (p. 548)), or for meshes with non-conformal boundaries (see Non-Conformal Meshes (p. 148)).
Controls

**Mesh Interface**
contains a text entry box in which you can set the name of the mesh interface, and a list from which you can select an existing mesh interface.

**Interface Zone 1, Interface Zone 2**
contain lists from which you can select the two interface zones that comprise the mesh interface, and informational fields that show the name of the zone you selected in each list. (You cannot edit these fields; the name in this field will be the name of the zone you selected in the list below it.)

**Interface Options**
contains options related to the interface type.

- **Periodic Boundary Condition**
  allows you to create a non-conformal periodic boundary condition interface.

- **Periodic Repeats**
is relevant when you have two zones coming together, such as a rotor and stator. When the two zones move, a portion of the geometry will intersect and that will be an interior zone, but on either side of the interior, the zone is termed periodic repeats.

- **Coupled Wall**
  indicates (if enabled) that the interface acts as a thermally coupled wall.

- **Matching**
is relevant if only interface interior zones should be created, that is, the interface boundary zones should be empty because the interface zones on both sides are aligned. With the **Matching** option,
even interface zones that are not perfectly aligned are treated as if they would be, however, if the discrepancy between the interface zones on both sides exceeds default thresholds, then warning messages will be displayed. Note that the Matching option is also compatible with periodic boundary conditions. See Matching Option (p. 155) for more information about the recommended uses of this option.

**Boundary Zone 1, Boundary Zone 2**

display the names of the wall boundary zones that ANSYS Fluent creates during the creation of a non-periodic mesh interface. If the two interface zones overlap each other, then the wall boundaries are created but with zero faces.

**Interface Interior Zone**

displays the names of the interface interior zones created. This is used for embedded LES, when there is a need to be able to convert an interior zone into a RANS-LES interface.

**Interface Wall Zone 1, Interface Wall Zone 2**

display the names of the wall interface zones (for example, wall-4, wall-4-shadow), which are created if the Coupled Wall option is enabled.

**Periodic Boundary Condition**

**Type**

allows you to select a periodicity that is either Translational or Rotational.

**Offset**

is the offset coordinates or angle, depending on whether Translational or Rotational periodicity is selected. Note that when Auto Compute Offset is enabled, the Offset fields are not editable.

**Auto Compute Offset**

will result in ANSYS Fluent finding the offset. If this option is disabled, then you will have to provide the offset coordinates or angle in the required fields, depending on whether Translational or Rotational periodicity is selected.

**Create**

creates the specified mesh interface (and gives it the name specified under Mesh Interface).

**Delete**

deletes the mesh interface selected under Mesh Interface.

**Draw**

allows you to display interface zones or mesh interfaces in the graphics window. Note that you can only select and display interface zones from Interface Zone 1 or Interface Zone 2 prior to defining any Mesh Interfaces. After a Mesh Interface is defined, you can select the appropriate mesh interface and click the Draw button to display the zones under Interface Zone 1 and Interface Zone 2 together as defined by the Mesh Interface.

**List**

lists information about the selected Mesh Interface. When you click this button, ANSYS Fluent will report (in the console window) the two interface boundaries and all new zones that were created (that is, interior, wall, or periodic zones).
35.10. Dynamic Mesh Task Page

The **Dynamic Mesh** task page allows you to define all the parameters for modeling a dynamic mesh model. See [Setting Dynamic Mesh Modeling Parameters (p. 575)](p. 575) for details about using the items below.

**Controls**

**Dynamic Mesh**
enables the dynamic mesh model and activates the controls in the task page.

**Mesh Methods**
contains options to specify the mesh update method(s).

- **Smoothing**
enables mesh smoothing. See [Smoothing Methods (p. 576)](p. 576) for details about the smoothing methods available.

- **Layering**
enables the dynamic layering method that can be used to add or remove layers of cells adjacent to a moving boundary based on the height of the layer adjacent to the moving surface in prismatic mesh zones. See [Dynamic Layering (p. 592)](p. 592) for details.
**Remeshing**

enables the local or zonal remeshing methods. In local remeshing, the cells that violate the skewness or size criteria are agglomerated and locally remeshed; see Local Remeshing Method (p. 599) for further details. In zonal remeshing, the complete cell zone (including the boundary zones) is remeshed; see CutCell Zone Remeshing Method (p. 612) for further details.

**Settings...**

displays the Mesh Method Settings Dialog Box (p. 2177) in which you can specify settings for the Smoothing, Layering, and, Remeshing methods.

**Options**

contains options to specify specialized dynamic mesh models.

**In-Cylinder**

enables the in-cylinder model. See In-Cylinder Settings (p. 621) for more information.

**Six DOF**

enables six degrees of freedom solver. See Using the Six DOF Solver (p. 637) for more information.

**Implicit Update**

specifies that the mesh is updated during a time step (as opposed to just at the beginning of a time step). See Implicit Update Settings (p. 638) for more information.

**Contact Detection**

enables contact detection. See Contact Detection Settings (p. 640) for more information.

**Settings...**

opens the Options Dialog Box (p. 2181), where you can set the parameters for the options that are enabled in the Options group box.

**Events...**

displays the Dynamic Mesh Events Dialog Box (p. 2186).

**Dynamic Mesh Zones**

displays a list of dynamic mesh zones.

**Create/Edit...**

displays the Dynamic Mesh Zones Dialog Box (p. 2190).

**Delete**

removes the selected dynamic zone(s) from the Dynamic Mesh Zones list.

**Delete All**

removes all dynamic zones from the Dynamic Mesh Zones list.

**Display Zone Motion...**

displays the Zone Motion Dialog Box (p. 2199).

**Preview Mesh Motion...**

displays the Mesh Motion Dialog Box (p. 2200).

For additional information, see the following sections:

35.10.1. Mesh Method Settings Dialog Box
35.10.2. Mesh Scale Info Dialog Box
35.10.3. Options Dialog Box
35.10.1. Mesh Method Settings Dialog Box

The **Mesh Method Settings** dialog box allows you to apply settings for the smoothing, layering, or remeshing methods.

![Mesh Method Settings Dialog Box](image)

**Smoothing**
- contains parameters to be specified for the smoothing mesh update method.

**Method**
- allows you to specify the smoothing method.
**Spring/Laplace/Boundary Layer**

specifies that the smoothing method is spring based, or appropriate for the Laplacian smoothing method (for 2.5D remeshing) or the boundary layer smoothing method.

**Diffusion**

selects the diffusion-based smoothing method.

**Linearly Elastic Solid**

selects smoothing based on the equations for a linearly elastic solid.

**Parameters**

allows you to define the settings for the smoothing.

**Spring Constant Factor**

controls the spring stiffness.

**Convergence Tolerance**

controls the smoothing convergence.

**Number of Iterations**

specifies the number of iterations.

**Elements**

controls the elements where spring-based smoothing is applied.

**Tet in Tet Zones**

(3D only) only cell zones with all tetrahedral elements get smoothed.

**Tet in Mixed Zones**

(3D only) tetrahedral elements in mixed element zones get smoothed.

**Tri in Tri Zones**

(2D only) only cell zones with all triangular elements get smoothed.

**Tri in Mixed Zones**

(2D only) triangular elements in mixed element zones get smoothed.

**All**

all element types get smoothed.

**Laplace Node Relaxation**

specifies how the update of the node positions is relaxed on boundaries where there is Laplacian smoothing.

**Diffusion Function**

specifies whether the diffusion coefficient is a function of the boundary-distance (Equation 10.8 (p. 582)) or the cell-volume (Equation 10.9 (p. 582)). This drop-down list is only available when Diffusion is selected from the Method list.

**Diffusion Parameter**

specifies $\alpha$ in Equation 10.8 (p. 582) or Equation 10.9 (p. 582), depending on the selected Diffusion Function. This number-entry box is only available when Diffusion is selected from the Method list.
Poisson’s Ratio
specifies the linearly elastic solid material property $\nu$ in Equation 10.12 (p. 587).

Layering
contains parameters to be specified for the layering mesh update method.

Options
specifies the criteria for splitting or collapsing cell layers.

Height Based
specifies that the cell layers are split or merged based on height.

Ratio Based
specifies that the cell layers are split or merged based on ratios.

Split Factor
specifies the value of $\alpha_s$ in Equation 10.15 (p. 593). It controls the height or ratio at which the cells are split.

Collapse Factor
specifies the value of $\alpha_c$ in Equation 10.16 (p. 594). It controls the height or ratio at which the cells are collapsed and merged into the next layer.

Remeshing
contains parameters to be specified for the remeshing mesh update method.

Remeshing Methods
contain options that control remeshing.

Local Cell
allows you to remesh deforming boundary cells.

Local Face
allows you to remesh deforming boundary faces. This option is available for 3D cases.

Region Face
allows you to remesh a region.

CutCell Zone
allows you to replace an entire cell zone with a predominantly Cartesian mesh. This option is only available for 3D cases. Note that the parameters that control this remeshing method are set in the Dynamic Mesh Zones dialog box. See Using the CutCell Zone Remeshing Method (p. 614) for more information.

2.5D
enables the 2.5D model. This option is only available for 3D cases. See Using the 2.5D Model (p. 617) for more information.

Parameters
contains parameters that control remeshing for all of the remeshing methods except for CutCell Zone.

Minimum Length Scale
specifies the lower limit of cell size below which the cells are marked for remeshing.
Maximum Length Scale
specifies the upper limit of cell size above which the cells are marked for remeshing.

Maximum Cell Skewness
specifies the desired maximum skewness for the mesh.

Maximum Face Skewness
specifies the desired maximum skewness for the surface mesh. This option is active, when Local Face is selected under Remeshing Methods.

Size Remeshing Interval
specifies the interval in time steps for remeshing based on the above size criteria only. Marking of cells based on skewness occurs automatically at every time step when Remeshing is enabled.

Mesh Scale Info...
opens the Mesh Scale Info Dialog Box (p. 2180), in which you can view the statistics of the mesh, such as the minimum and maximum length scale values and the maximum cell and face skewness values.

Use Defaults
resets the remeshing parameters to the default values.

Sizing Function
contains parameters that control the sizing function.

On
allows you to enable or disable the sizing function.

Resolution
sets the resolution for the sizing function. See Setting Dynamic Mesh Modeling Parameters (p. 575) for more information. This item will appear only if Sizing Function is enabled.

Variation
specifies the value of $\alpha$ in Equation 10.22 (p. 605). This item will appear only if Sizing Function is enabled.

Rate
specifies the value of $\beta$ in Equation 10.23 (p. 605). This item will appear only if Sizing Function is enabled.

Use Defaults
resets the sizing function parameters to the default values. This item will appear only if Sizing Function is enabled.

35.10.2. Mesh Scale Info Dialog Box

The Mesh Scale Info dialog box allows you to inspect the values of minimum and maximum length scale and maximum cell/face skewness in a mesh.
Controls

**Minimum Length Scale**
- displays the lower limit of cell size below which the cells are marked for remeshing.

**Maximum Length Scale**
- displays the upper limit of cell size below which the cells are marked for remeshing.

**Maximum Cell Skewness**
- displays the maximum cell skewness in the zone.

**Maximum Face Skewness**
- displays the maximum cell skewness in the surface mesh.

### 35.10.3. Options Dialog Box

The **Options** dialog box allows you to set the parameters for the options available in the **Options** group box of the **Dynamic Mesh** task page.
In-Cylinder contains parameters to be specified for the in-cylinder model. See In-Cylinder Settings (p. 621) for more information.

**Crank Shaft Speed**
specifies the speed of the crank shaft.

**Starting Crank Angle**
specifies the starting crank angle.

**Crank Period**
specifies the crank period.

**Crank Angle Step Size**
specifies the crank angle step size used to determine the time step size to advance the solution.

**Crank Radius**
specifies the crank radius to calculate the piston location.

**Piston Pin Offset**
specifies the perpendicular offset of the piston pin from the plane defined by the crank shaft axis and the direction of motion of the piston. The sign of this value is positive if top-dead-center (TDC) occurs prior to a crank angle of 0°.

**Connecting Rod Length**
specifies the length of the connecting rod.
Piston Stroke Cutoff
specifies the piston stroke cutoff used to control the onset of layering in the cylinder chamber.

Minimum Valve Lift
specifies the minimum valve lift.

Write In-Cylinder Output
enables or disables the writing of in-cylinder specific output parameters. When this option is enabled, the Output Controls... button becomes active.

Output Controls...
displays the In-Cylinder Output Controls Dialog Box (p. 2184) and is available only after the Write In-Cylinder Output option is enabled.

Six DOF
contains parameters to be specified for the six DOF solver. See Six DOF Solver Settings (p. 636) for more information.

Gravitational Acceleration
contains the text entry boxes for gravitational acceleration in X, Y, and Z directions.

X, Y, Z
specifies the gravitational acceleration in X, Y, and Z directions respectively.

Write Motion History
allows you to keep track of an object's motion history.

File Name
allows you to specify a file name for saving the object’s motion history.

Implicit Update
contains parameters to be specified for implicit mesh updating. See Implicit Update Settings (p. 638) for more information.

Update Interval
allows you to specify the frequency in iterations at which the mesh will be updated within a time step.

Motion Relaxation
allows you to set a value (within the range of 0 to 1) for $\omega$ in Equation 10.29 (p. 639), which defines the relaxation of the motion (that is, displacement of the nodes) during the mesh update.

Residual Criteria
allows you to set the relative residual threshold that is used to check the motion convergence.

Contact Detection
contains parameters to be specified for contact detection. See Contact Detection Settings (p. 640) for more information.

Face Zones
allows you to select the face zones that will be involved in contact detection.

Proximity Threshold
allows you to set the threshold below which the user-defined function for contact detection will be invoked.
UDF
allows you to specify the user-defined function that will be invoked when contact has been detected.

Flow Control
allows you to indicate whether flow control zones are going to be used in the contact detection process.

Controls...
opens the Flow Controls Dialog Box (p. 2185) where you can make additional flow control settings.

35.10.4. In-Cylinder Output Controls Dialog Box

The In-Cylinder Output Controls dialog box contains parameters that control the output for the in-cylinder model. See In-Cylinder Settings (p. 621) for more information.

Controls

In-Cylinder Data Write Frequency
represents an integer entry specifying the interval in number of time-steps. Make sure that a value other than 0 is used for the frequency, in order to allow you to complete your setup.

Swirl Center Method
contains a drop-down list that allows you to select the method to calculate the swirl center. The list contains center of gravity and fixed, with center of gravity being the default value.
center of gravity
calculates the swirl center inside the code and is used as the center of gravity of the chosen cell
zones.

fixed
enables you to specify a swirl center in the X, Y, and Z entry fields below the drop-down list.

In addition to these two options, you can chose to use your own Compiled UDF to calculate the
swirl center. For details on using a dynamic mesh UDF, see the separate for information on user-
declared functions.

Cell Zones
is a list that displays the names of all existing cell zones in the case files. You can select only the zones
relevant for the swirl and tumble calculations.

Swirl Axis
specifies the swirl axis with three entries for the directional components. By default, X, Y, Z = 0, 1, 0.

Tumble Axis
specifies the directional components of Tumble Axis in X, Y, Z directions. By default, X, Y, Z = 0, 0, 1.
This applies only in 3D.

Cross Tumble Axis
specifies the directional components of Cross Tumble Axis in X, Y, Z directions. By default, X, Y, Z = 1, 0, 0.
This applies only in 3D.

File Name
specifies the name of the In-Cylinder output file. By default, the file name contains the name of the
case file appended with a .txt extension.

35.10.5. Flow Controls Dialog Box

The Flow Controls dialog box allows you to specify flow control cell zones that are going to be used
in the contact detection process. See Contact Detection Settings (p. 640) for more information.
Controls

Cell Zones
is a list that displays the names of all existing cell zones.

Settings
contains flow control zone settings.

Flow Control Zone
enables you to specify a name for the flow control zone.

Create Zone
enables you to create a new flow control zone of the specified name.

35.10.6. Dynamic Mesh Events Dialog Box

The Dynamic Mesh Events dialog box is available to control the timing of specific events during the course of the simulation. See Defining Dynamic Mesh Events (p. 641) for details.
Controls

**Number of Events**
specifies the number of events to be defined.

**On**
enables the corresponding event.

**Name**
specifies the name of the event.

**At Crank Angle**
specifies the angular location of the crank at which the event should occur. This option appears for in-cylinder flows.

**At Time**
specifies the time (in seconds) at which you want the event to occur. This option appears for non-in-cylinder flows.

**Define...**
opens the Define Event Dialog Box (p. 2188).

**Read...**
opens The Select File Dialog Box (p. 15).

**Write...**
opens The Select File Dialog Box (p. 15).

**Preview...**
opens the Events Preview Dialog Box (p. 2190).
35.10.7. Define Event Dialog Box

The **Define Event** dialog box allows you to define events.

### Controls

**Name**
contains the name of the event to be defined.

**Type**
specifies the type of event. You can choose the type of event from the drop-down list. These event types and their definitions are described in *Events (p. 645)*.

**Definition**
contains the input parameters corresponding to the type of event selected under **Type**.

**Zone**
contains a selectable list of the zones. The selection specifies the name of the zone(s) to be changed. This item will appear only for the **Change Zone Type** event.

**New Zone Type**
specifies the type of zone to which an existing zone must be changed. This item will appear only for the **Change Zone Type** event.

**From Zone**
specifies the name of the zone from which the boundary condition is to be copied. This item will appear only for the **Copy Zone BC** event.

**To Zone(s)**
specifies the name of the zone to which the boundary condition is to be copied. This item will appear only for the **Copy Zone BC** event.
Zone(s)  
contains a selectable list of the zones. The selection specifies the name of the zone to be activated/deactivated. This item will appear only for the Activate Cell Zone and Deactivate Cell Zone events.

Interface Name  
contains the name of the interface to be created or deleted. This item will appear only for the Create Sliding Interface and Delete Sliding Interface events.

Interface Zone 1, Interface Zone 2  
specifies the two zones on either side of the interface to be created. This item will appear only for the Create Sliding Interface event.

Wall 1 Motion, Wall 2 Motion  
specifies the dynamic zones whose motion can be copied for the zones specified under Interface Zone 1 and Interface Zone 2. This item will appear only for the Create Sliding Interface event.

Attribute  
allows you to select the relevant motion attribute. This item will appear only for the Change Motion Attribute event.

Status  
allows you to enable or disable the motion attribute. This item will appear only for the Change Motion Attribute event.

Dynamic Mesh Zones  
contains a list of dynamic zones. This item will appear only for the Change Motion Attribute event.

Crank Angle Step Size  
specifies the new physical time step value in degrees. This item will appear only for the Change Time Step Size event.

Base Dynamic Zone  
specifies the zone from which the layer of cells is to be created. This item will appear only for the Insert Boundary Layer and Remove Boundary Layer event.

Side Dynamic Zone  
represents the deforming face zone adjacent to the Base Dynamic Zone before the layer is inserted. This item will appear only for the Insert Boundary Layer event.

Internal Zone 1 Name, Internal Zone 2 Name  
specifies the name of the new internal zones.

Time Step Size  
allows you to change the time step size of the event. This item will appear only for the Change Time Step Size event.

Under-Relaxation Factors  
allows you to specify the under-relaxation factors for the selected event. This item will appear only for the Change Under-Relaxation Factors event. See Setting Under-Relaxation Factors (p. 1418) for details.

Adjacent Dynamic Face Zone  
allows you to select the dynamic face zone adjacent to the location of the cell layer to be inserted (or deleted). You can select the required zone from the drop-down list.
**Direction Parameter**

is the direction with respect to the selected dynamic face zone a layer of cells is removed or added.

**Command**

specifies the series of text / Scheme commands or the macro to be executed during the simulation. This item will appear only for the **Execute Command** event.

### 35.10.8. Events Preview Dialog Box

The **Events Preview** dialog box allows you to play the events to check that they are defined correctly.

[Image of Events Preview dialog box]

**Controls**

**Start Crank Angle**

specifies the crank angle at which you want to start the preview (for in-cylinder flows).

**Start Time**

specifies the time at which you want to start the preview (for non-in-cylinder flows).

**End Crank Angle**

specifies the crank angle at which you want to end the preview (for in-cylinder flows).

**End Time**

specifies the time at which you want to end the preview (for non-in-cylinder flows).

**Increment**

specifies the size of the step to take during the preview.

**Preview**

plays back the events at the crank angle specified for each event and reports when each event occurs in the text (console) window.

### 35.10.9. Dynamic Mesh Zones Dialog Box

The **Dynamic Mesh Zones** dialog box allows you to specify the motion of the dynamic zones in your model. See **Specifying the Motion of Dynamic Zones** (p. 650) for details.
Controls

Zone Names
contains the names of the zones in the model.

Type
contains the types of motion that can be specified for a dynamic zone.

Stationary
explicitly declares the zone as stationary, so that the nodes on this zone are excluded when updating the node positions. See Specifying the Motion of Dynamic Zones (p. 650) for more information.

Rigid Body
specifies the zone as having a rigid-body motion.

Deforming
specifies the zone as deforming.

User-Defined
enables you to specify a user-defined zone motion.

System Coupling
allows the zone to be involved in a system coupling simulation where the motion is defined by the application that ANSYS Fluent is coupled with on this zone (see the Fluent in Workbench User's Guide and the System Coupling Guide for more details). Once enabled, the Solver Options tab can be used to help achieve convergence for system coupling cases where the physics is strongly coupled.
If a dynamic mesh zone of the type **System Coupling** exists, and ANSYS Fluent is not involved in a system coupling simulation, then this zone type behaves in the same way as a stationary zone.

**Dynamic Mesh Zones**
lists all of the dynamic zones in the case.

**Motion Attributes**
contains parameters to specify the motion attributes for a rigid-body-motion zone and a user-defined-motion zone.

**Motion/UDF Profile**
specifies the motion of the rigid body zone by selecting a profile or user-defined function from the drop-down list. This option is available only if the **Six DOF** solver is the selected model.

**Six DOF Options**
contains parameters for the six DOF solver.

- **On** enables the use of the six DOF solver.
- **Passive** (if enabled) does not take forces and moments on the zone into consideration.

**Center of Gravity Location**
contains the current values of the coordinates for the location of the center of gravity (CG) of the selected zone. This item will appear only if the motion **Type** is **Rigid Body**, if **In-Cylinder** is not enabled in the **Dynamic Mesh Parameters** dialog box.

**Center of Gravity Orientation**
contains the current values of the coordinates for the orientation defined at the CG of the selected zone. This item will appear only if the motion **Type** is **Rigid Body**, if **In-Cylinder** is not enabled in the **Dynamic Mesh Parameters** dialog box.

**Center of Gravity Velocity**
specifies the velocity of the center of gravity with respect to inertia coordinate system. This option is available only if the **Six DOF** solver is the selected model.

**Center of Gravity Angular Velocity**
specifies the angular velocity of the center of gravity with respect to inertia coordinate system. This option is available only if the **Six DOF** solver is the selected model.

**Lift/Stroke**
contains the current value of valve lift or piston stroke, which is automatically updated when you click **Create**. This item will appear only if **In-Cylinder** is enabled in the **Dynamic Mesh Parameters** dialog box.

**Valve/Position Axis**
specifies the direction of the reference axis of the valves or piston for an in-cylinder problem. This item will appear only if **In-Cylinder** is enabled in the **Dynamic Mesh** task page.
Mesh Motion UDF
allows you to select the user-defined function that defines the geometry and motion of the zone. This item will appear only if the motion Type is User-Defined.

Exclude Mesh Motion in Boundary Conditions
allows you to specify that the boundary mesh motion should not be included in the physical boundary conditions of that zone. This option is only available for non-periodic boundary zones.

Geometry Definition
contains parameters to define a deforming zone.

Definition
allows you to select a geometry definition to project nodes of the deforming zone on. Available options are faceted, plane, cylinder, and user-defined.

Feature Detection
allows you to preserve features on deforming zones between the different face zones and within a face zone.

Include Features
includes features of a specific angle.

Feature Angle
specifies feature angle in degrees.

Point on Plane
allows you to specify the position of a point on the plane. This item will appear only when you select plane for the Definition.

Plane Normal
allows you to specify the direction of the plane normal. This item will appear only when you select plane for the Definition.

Cylinder Radius
allows you to specify the radius of the cylinder. This item will appear only when you select cylinder for the Definition.

Cylinder Origin
allows you to specify the location of the cylinder origin. This item will appear only when you select cylinder for the Definition.

Cylinder Axis
allows you to specify the direction of the cylinder axis. This item will appear only when you select cylinder for the Definition.

Geometry UDF
allows you to select a user-defined function for a geometry Definition.

Meshing Options
contains parameters for various meshing options.

Adjacent Zone
contains the name of the adjacent zone that is involved in local remeshing or dynamic layering. This item will appear only if the zone type is Stationary, Rigid Body, or User-Defined, and if the zone is not the boundary of a CutCell dynamic cell zone.
**Cell Height**
allows you to specify the ideal height of the adjacent cells as either a constant value or a compiled user-defined function. This item will appear only if the motion **Type** is **Stationary**, **Rigid Body**, or **User-Defined**, and if the zone is not the boundary of a CutCell dynamic cell zone.

**Deform Adjacent Boundary Layer with Zone**
enables the smoothing of an adjacent boundary layer mesh. This option is not available when **Stationary** or **Deforming** is selected in the **Type** list.

**Methods**
contains options to specify the mesh update method(s) and controls on a zone by zone basis. These options and parameters will override those that you specified globally in the **Dynamic Mesh** task page. This item will appear only if the motion **Type** is **Deforming**.

**Smoothing**
enables the smoothing mesh update method.

**Layering**
enables the layering mesh update method (valid for a prismatic cell zone only). This item will appear only if the zone you are defining is a cell (fluid) zone.

**Remeshing**
enables the remeshing mesh update method.

**Smoothing Elements**
allows you to specify the element types for which spring-based smoothing is used. This item will only be available if you have selected a cell zone and if spring-based smoothing has been enabled.

**Global Settings**
specifies that the zonal settings are the same as set globally in the Mesh Method Settings dialog box (see **Applicability of the Spring-Based Smoothing Method** (p. 581) or **Mesh Method Settings Dialog Box** (p. 2177)).

**Tet in Tet Zones**
(3D only) specifies that this zone will only get smoothed if it consists entirely of tetrahedral elements.

**Tri in Tri Zones**
(2D only) specifies that this zone will only get smoothed if it consists entirely of triangular elements.

**Tet in Mixed Zones**
specifies that all simplex elements in this zone should get smoothed. All other elements in a mixed element zone will not undergo smoothing.

**All**
especifies that all element types in this zone will get smoothed.

**Zone Parameters**
contains a set of remeshing criteria, other than those you specified globally in the **Mesh Method Settings** dialog box. Note that this group box is not available if the **CutCell** option in the **Remeshing Options** group box is enabled.
Minimum Length Scale
allows you to specify the minimum length scale for the zone. This item will appear only if the zone you are defining is a cell (fluid) zone.

Maximum Length Scale
allows you to specify the maximum length for the zone. This item will appear only if the zone you are defining is a cell (fluid) zone.

Maximum Skewness
allows you to specify the desired value for maximum skewness.

Zone Scale Info...
opens the Zone Scale Info Dialog Box (p. 2198), in which you can view the statistics of the mesh, such as minimum, maximum, and average length scale values, as well as the maximum skewness.

CutCell Zone Parameters
contains a set of global parameters used for CutCell zone remeshing. This group box will only appear if the zone selected in the Dynamic Mesh Zones list is a cell zone, and if the CutCell option is enabled in the Remeshing Options group box.

Maximum Mesh Size
allows you to specify the maximum mesh size of the Cartesian CutCell mesh.

Growth Rate
allows you to specify the default growth rate used for mesh refinement by size functions. This growth rate is used during remeshing by the mesh-based size functions of all boundaries of the CutCell cell zone that are not defined as dynamic mesh zones.

Minimum Orthogonal Quality
allows you to specify the minimum allowable orthogonal quality for the cell zone. CutCell remeshing will occur if the orthogonal quality for any cell in the cell zone drops below this value.

Remeshing Interval
specifies the interval of time steps at which the cell zone remeshing will take place, even if the mesh quality has not deteriorated below the value entered for Minimum Orthogonal Quality. Enter a value of 0 for the Remeshing Interval if you want the remeshing to occur only if there is insufficient mesh quality.

Inflation Layers
allows you to enable inflation layers on the CutCell cell zone and specify global inflation parameters.

Settings...
opens the Inflation Settings Dialog Box (p. 2197), which allows you to enter the global inflation parameters used by default on all boundary zones.

Boundary Zones Info...
opens the CutCell Boundary Zones Info Dialog Box (p. 2198), which lists all of the boundary zones for the CutCell dynamic cell zone, along with the remeshing and inflation layer parameters.

Zone Scale Info...
opens the Zone Scale Info Dialog Box (p. 2198), in which you can view the statistics of the mesh, such as minimum, maximum, and average length scale values, as well as the maximum skewness.
**CutCell Boundary Zone Parameters**
contains a set of local parameters used for CutCell zone remeshing. This group box will only appear if the zone selected in the **Dynamic Mesh Zones** list is a boundary of a CutCell dynamic cell zone.

**Maximum Mesh Size**
allows you to specify the maximum mesh size used by the soft size function. If a value of 0 is entered, a mesh-based size function is used to locally refine the Cartesian mesh near the boundary.

**Growth Rate**
allows you to specify the local growth rate used by the size function.

**Zonal Inflation Layer Control**
allows you to enable local inflation layer control and specify local inflation parameters. This option is only available if **Inflation Layers** has been enabled for the CutCell dynamic cell zone. If **Zonal Inflation Layer Control** is not enabled, then the global inflation parameters specified for the cell zone are used.

**Settings...**
opens the **Inflation Settings Dialog Box** (p. 2197), which allows you to enter local inflation parameters for the CutCell boundary zone.

**Zone Scale Info...**
opens the **Zone Scale Info Dialog Box** (p. 2198), in which you can view the statistics of the mesh, such as minimum, maximum, and average length scale values, as well as the maximum skewness.

**Smoothing Methods**
contains two methods of smoothing. This option is only available if spring-based smoothing has been selected in the **Mesh Method Settings** dialog box.

- **Spring**
enables spring-based smoothing method.

- **Laplace**
enables Laplacian smoothing method.

**Remeshing Methods**
contains two methods of remeshing.

- **Region**
enables region-based remeshing method.

- **Local**
enables local remeshing method.

**Remeshing Options**
contains one method of remeshing.

- **CutCell**
enables the CutCell zone remeshing method. This option is only available when the **CutCell Zone** is enabled in the **Mesh Method Settings** dialog box, and if the zone selected in the **Dynamic Mesh Zones** list of the **Dynamic Mesh Zones** dialog box is a cell zone.
**Solver Options**
contains parameters for various solver options for system coupling dynamic mesh zones. See [System Coupling Motion (p. 663)](#) for more information.

**Solution Stabilization**
enables/disables solution stabilization settings for system coupling dynamic mesh zones.

**Stabilization Parameters**
contains options for solution stabilization settings.

**Scale Factor**
allows you to set the scale factor used by the selected **Method** for convergence stabilization. The default value is 0.1.

**Method**
Stabilization is achieved through a boundary source coefficient introduced in the continuity equation. It is designed to improve the diagonal dominance of the matrix system in the cells adjacent to system coupling boundaries. Two methods for this boundary source coefficient are available:

- **volume-based** (default) specifies that the diagonal entry of the linear matrix system corresponding to the discretized continuity equation is re-scaled using the cell volume and a scale factor, according to [Equation 10.32](#). (p. 664).

- **coefficient-based** specifies that the diagonal entry of the linear matrix system corresponding to the discretized continuity equation is directly re-scaled by a scale factor, according to [Equation 10.33](#). (p. 664).

---

**35.10.10. Inflation Settings Dialog Box**

The **Inflation Settings** dialog box allows you to enter inflation layer parameters for a dynamic zone.

![Inflation Settings Dialog Box](image)

**Controls**

**Offset Method**
allows you to select how the first layer height is evaluated. The **constant** type will use the same first height for all elements. The **aspect-ratio** type will evaluate local first heights such that the aspect ratio (base size divided by the element height) of the resulting elements is constant.
**First Aspect Ratio**
allows you to specify the aspect ratio of the first element if the **Offset Method** is set to **aspect-ratio**.

**First Height**
allows you to specify the height of the first element if the **Offset Method** is set to **constant**.

**Growth Rate**
allows you to specify the geometric growth rate of the inflation element heights.

**Number of Layers**
allows you to specify the number of elements in the inflation layer.

**Last Aspect Ratio**
displays the aspect ratio of the last element for the given set of parameters if the **Offset Method** is set to **aspect-ratio**.

**Total Height**
displays the overall thickness of the inflation layer if the **Offset Method** is set to **constant**.

### 35.10.11. CutCell Boundary Zones Info Dialog Box

The **CutCell Boundary Zones Info** dialog box displays a list of all of the boundary zones for the CutCell dynamic cell zone. This list also provides the remeshing parameters for the zones, including size function type, the maximum mesh size, the growth rate used to refine the mesh at all of the CutCell boundaries. The inflation layer settings used on all boundaries are also shown.

![CutCell Boundary Zones Info dialog box](image)

### 35.10.12. Zone Scale Info Dialog Box

The **Zone Scale Info** dialog box allows you to inspect the values of minimum and maximum cell area or volume, and maximum cell skewness in a zone.
Controls

Maximum Length Scale
displays the maximum cell length in the zone.

Minimum Length Scale
displays the minimum cell length in the zone.

Average Length Scale
displays the average cell length in the zone.

Maximum Skewness
displays the maximum cell skewness in the zone.

35.10.13. Zone Motion Dialog Box

The Zone Motion dialog box will display the motion of zones specified with Rigid Body or User-Defined motion. See Previewing the Dynamic Mesh (p. 667) for details about the items below.

Controls

Time Control
contains controls to specify the time intervals at which to display the motion.
**Start Time (s)**
specifies the time from which to start the zone motion preview.

**Time Step (s)**
specifies time step size for zone motion preview.

**Number of Steps**
specifies number of time steps for zone motion preview.

**Dynamic Face Zones**
allows you to select the dynamic face zones to preview. Only **User-Defined** or **Rigid Body** zones are available.

**Preview**
previews the zone motion.

**Reset**
resets the zone display and the dialog box inputs.

### 35.10.14. Mesh Motion Dialog Box

The Mesh Motion dialog box allows you to preview the dynamic mesh as it changes with time before you start your simulation. See **Previewing the Dynamic Mesh (p. 667)** for details.

![Mesh Motion Dialog Box](image)

**Controls**

**Time**
contains the parameters to specify the time interval at which to update the mesh.

- **Current Mesh Time**
displays the current time after the dynamic mesh has been advanced the specified number of steps.

- **Time Step Size**
specifies the size of each time step.

- **Number of Time Steps**
specifies the number of time steps.

**Options**
contains options to view the updated mesh.
Display Mesh
   displays the mesh.

Save Picture
   opens the Save Picture Dialog Box (p. 2309), allowing you to save a picture file of the mesh each time ANSYS Fluent updates it during the mesh preview.

Enable Autosave
   opens the Autosave Case During Mesh Motion Preview Dialog Box (p. 2201), allowing you to save the case and data files with the specified name and frequency. See Automatic Saving of Case and Data Files (p. 49) for details.

Update Mesh Interfaces
   allows you to update the interface at every time step.

Update Monitors
   allows you to disable the processing of monitors and computation activities during mesh motion preview.

Display Frequency
   displays the frequency at which ANSYS Fluent will update the mesh display.

Preview
   allows you to preview the motion of the selected zones in the graphics window.

35.10.15. Autosave Case During Mesh Motion Preview Dialog Box

The Autosave Case During Mesh Motion Preview dialog box allows you to automatically save your case during the dynamic mesh preview as it changes with time, while running your simulation. See Automatic Saving of Case and Data Files (p. 49) for details about the inputs.

Controls

Save Case File Every
   contains the parameters to specify the time interval at which to update the mesh.
Retain Only the Most Recent Files
allows you to restrict the number of files saved by ANSYS Fluent if you have limited disk space. When this option is enabled, you can enter the appropriate value in the Maximum Number of Data Files field.

Note
Only the associated case files are retained when using this option.

Maximum Number of Data Files
specifies the maximum number of data files that can be saved at any instance. If you have constraints on the disk space, you can restrict the number of files to be saved using this field. After saving the specified number of files, ANSYS Fluent will overwrite the earliest existing file. The default value for this field is zero, which saves all the files.

Append File Name with
allows you to select flow-time or time-step to be appended to the file name. This option is available only for unsteady-state calculations. The default selection is flow-time.

35.11. Reference Values Task Page
The Reference Values task page allows you to set the reference quantities used for computing normalized flow field variables. It also allows you to specify the reference zone for postprocessing relative velocities in moving-zone problems. See Reference Values (p. 1760) for details about the items below.
### Reference Values

**Compute From**
- **wall**

**Reference Values**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>

</tbody>
</table>

**Reference Zone**
- **fluid**

### Controls

**Compute from** contains a drop-down list of the boundary zones. You may select a zone to be used for automatically defining the reference values, but depending on the boundary condition used, all of the reference values may not be set. For example, the reference length and area will not be set by computing the reference values from a boundary condition; you must set these manually.

**Reference Values** contains inputs for the reference values.

- **Area**
  - sets the reference area, which is used to compute the force and moment coefficients.

- **Depth**
  - sets the reference depth used for computing cell volumes in 2D.

- **Density**
  - sets the reference density, which is used to compute the reference dynamic pressure.

- **Enthalpy**
  - sets the reference enthalpy, which is used to determine the total enthalpy change.

- **Length**
  - sets the reference length, which is used in the computation of the moment coefficient.
Pressure
sets the reference pressure, which is used to compute the pressure-related forces and moments and the pressure coefficient.

Temperature
sets the reference temperature, which is used to compute entropy for incompressible flows.

Velocity
sets the reference velocity magnitude, which is used to compute the reference dynamic pressure.

Viscosity
sets the reference kinematic viscosity, which is used in the computation of the boundary Reynolds number.

Ratio of Specific Heats
sets the value of the specific heat ratio, which is used in turbomachinery efficiency calculations.

Reference Zone
contains a drop-down list of all cell zones in the domain. For flows involving multiple moving zones, you must select the reference zone for postprocessing relative velocities and related quantities. See Setting the Reference Zone (p. 1762) for details.

35.12. Solution Task Page

The Solution task page introduces you to the main tasks involved in solving your CFD simulation using ANSYS Fluent. For more information about using ANSYS Fluent to solve your CFD simulation, see Using the Solver (p. 1405).

35.13. Solution Methods Task Page

The Solution Methods task page allows you to specify various parameters associated with the solution method to be used in the calculation.
Controls

Formulation
provides a drop-down list of the available types of solver formulations: **Implicit** and **Explicit**.

This item appears only when the density-based solver is used.

Flux Type
provides a drop-down list of the convective flux types: **Roe-FDS**, **AUSM**, and **Low Diffusion Roe-FDS**. Details about each of the flux types can be found in *Convective Fluxes* in the Theory Guide.

Pressure-Velocity Coupling
contains settings for pressure-velocity coupling schemes.

  **Scheme**
  provides a drop-down list of the available pressure-velocity coupling schemes: **SIMPLE**, **SIMPLEC**, **PISO**, and **Coupled Fractional Step**. Fractional Step is available in the drop-down list when the non-iterative time advancement (NITA) scheme is enabled in the Solution Methods task page. See Pressure-Velocity Coupling in the Theory Guide and Choosing the Pressure-Velocity Coupling Method (p. 1415) and Setting Solution Controls for the Non-Iterative Solver (p. 1420) for details about these methods.

  This item appears only when the pressure-based solver is used.

  For multiphase flow, **Phase Coupled SIMPLE** and **Coupled** are available and are discussed in Selecting the Pressure-Velocity Coupling Method (p. 1369).
Skewness Correction

enables the SIMPLEC and PISO skewness correction for highly skewed meshes if the value (number of iterations) is greater than 0. The default value is 0 for SIMPLEC and 1 for PISO.

Neighbor Correction

enables the PISO neighbor correction, which is recommended for transient calculations, if the value (number of iterations) is greater than 0. The default value is 1.

Skewness-Neighbor Coupling

allows for a more economical but a less robust variation of the PISO algorithm.

Coupled with Volume Fraction

couples velocity corrections, shared pressure corrections, and the correction for volume fraction simultaneously. This option is available in the interface after you have selected Coupled from the Scheme drop-down list for Pressure-Velocity Coupling.

Spatial Discretization

contains settings that control the spatial discretization of the convection terms in the solution equations. See Choosing the Spatial Discretization Scheme (p. 1408) for details.

Gradient

Pressure

(for the pressure-based solver only) contains a drop-down list of the discretization schemes available for the pressure equation: Standard, PRESTO!, Linear, Second Order, and Body Force Weighted. This item appears only when the pressure-based solver is used.

Flow

(for the density-based solvers only) contains a drop-down list of the discretization schemes available for the pressure, momentum, and (if relevant) energy equations: First Order Upwind, Second Order Upwind, and Third-Order MUSCL. This item appears only when one of the density-based solvers is used.

Momentum, Energy, etc.

are the names of the other convection-diffusion equations being solved. In the drop-down list next to each equation, you can select the First Order Upwind, Second Order Upwind, Power Law, QUICK, or Third-Order MUSCL discretization scheme for that equation.

If the LES turbulence model is enabled, then you have a choice of selecting Bounded Central Differencing or Central Differencing to solve the convection-diffusion equations.

If one of the density-based solvers is used, Momentum and Energy will not appear. For the density-based solvers, the discretization scheme for these equations is selected in the Flow drop-down list (described above).

Volume Fraction

is available when the VOF multiphase model is enabled. The discretization schemes that are used when solving volume fraction equations for the VOF explicit scheme are Geo-Reconstruct, Compressive, CICSAM, Modified HRIC, and QUICK. The discretization schemes that are used when solving volume fraction equations for the VOF implicit scheme are First Order Upwind, Second...
Order Upwind, Compressive, Modified HRIC, BGM (steady state only), and QUICK. See Interpolation Near the Interface in the Theory Guide for detailed information about these VOF-specific interpolation schemes.

**Transient Formulation**
contains options for setting different time-dependent solution formulations. This option appears only when Transient is enabled under Time in the General task page. Available options include: Explicit (available only for the Density Based Explicit solver); First Order Implicit; Second Order Implicit; and Bounded Second Order Implicit. See Performing Time-Dependent Calculations (p. 1462) for details.

**Non-iterative Time Advancement**

**Frozen Flux Formulation**
enables an option to discretize the convective part of Equation 20.63 in the Theory Guide using the mass flux at the cell faces from the previous time level n. This option is available only for a Transient solution. See The Frozen Flux Formulation in the Theory Guide for details.

**Pseudo Transient**
enables an option to apply the pseudo transient under-relaxation method, which is a form of implicit under-relaxation (see Pseudo Transient Under-Relaxation). This option is available for the pressure-based solver when Coupled is selected as the Pressure-Velocity Coupling scheme and for the density-based implicit solver. Note that this method can only be used when running a steady-state simulation.

**Convergence Acceleration For Stretched Meshes**
Enable convergence acceleration for stretched meshes to improve the convergence of the implicit density based solver on meshes with high cell stretching (see Convergence Acceleration for Stretched Meshes (CASM) (p. 1427)).

**High Order Term Relaxation**
enables the relaxation of high order terms to aid in the solution behavior of flow simulations when higher order spatial discretization is used.

**Options...**
Opens the Relaxation Options Dialog Box (p. 2207).

**Set All Species Discretizations Together**
enables an option to use the same discretization scheme for all the species rather than setting each of the species individually. Notice that you will no longer see your list of individual species, instead a Species field will appear with the scheme of your choice. Note that this option is available when species transport is enabled.

**Default**
sets the fields to their default values, as assigned by ANSYS Fluent.

**Report Poor Quality Elements**
reports statistics on the number and type of cells that ANSYS Fluent has identified as having poor quality.

### 35.13.1. Relaxation Options Dialog Box

The Relaxation Options dialog box allows you to further control the High Order Term Relaxation as described in High Order Term Relaxation (HOTR) (p. 1411).
### Controls

**Variables**
allows you to select between under-relaxing **All Variables** or only the default flow variables (**Flow Variables Only**).

**Relaxation Factor**
is by default 0.25 for steady state cases and 0.75 for transient cases.

### 35.14. Solution Controls Task Page

The **Solution Controls** task page allows you to set common solution parameters.

#### Solution Controls

<table>

**Controls**

**Courant Number**
sets the fine-grid Courant number (time step factor) when the density-based solver is used. See [Changing the Courant Number (p. 1424)](p.1424) for guidelines on setting the Courant number.
When the pressure-based solver is used for time-independent flows, and the **Coupled** pressure-velocity scheme is used, the **Courant Number** is used to stabilize the convergence behavior. See **Under-Relaxation of Equations** in the Theory Guide for a correlation of the under-relaxation factor and courant number.

**Flow Courant Number**
sets the Courant number for multiphase flow using the pressure-based coupled solver. The Flow Courant Number is used to stabilize the convergence behavior.

**Volume Fraction Courant Number**
sets the Courant number for multiphase flow using the pressure-based solver is coupled with the volume fraction. The default value is 200 and will appear in the interface when the Coupled with Volume Fraction option appears in the Solution Methods task page.

**Explicit Relaxation Factors**
for the **Coupled** scheme defines the explicit relaxation of variables between sub-iterations for momentum and pressure. See **Under-Relaxation of Variables** in the Theory Guide for information.

**Multigrid Levels**
specifies the maximum number of coarse levels to be created by the FAS multigrid solver. This item is the same as the **Max Coarse Levels** under FAS Multigrid Controls in the Multigrid tab of the Advanced Solution Controls Dialog Box (p. 2212), and it appears only when the density-based explicit solver is used.

**Residual Smoothing**
contains parameters that govern the use of implicit residual smoothing. (See **Implicit Residual Smoothing** in the Theory Guide and **Using Residual Smoothing to Increase the Courant Number** (p. 1430) for details.) This section of the task page will appear only when the density-based explicit solver is used.

**Iterations**
sets the number of iterations of the Jacobi smoother to use. If **Iterations** is 0, then no implicit residual smoothing is performed.

**Smoothing Factor**
sets the implicit residual smoothing factor. This item will not appear unless **Iterations** is set to a non-zero value.

**Under-Relaxation Factors**
contains the under-relaxation factors for all equations that are being solved with the pressure-based solver. (See **Setting Under-Relaxation Factors** (p. 1418) for details.) In the field next to each equation, you can set the under-relaxation factor for that equation.

When one of the density-based solvers is used, **Under-Relaxation Factors** will appear only for the following variables, when they are included in your model: solid (for conjugate heat transfer models), turbulence variables, and viscosity. The density-based solvers use a segregated method to solve these equations; all the other equations are solved in a coupled manner, so there are no under-relaxation factors for them.

When **Non-iterative Time Advancement** is selected for the pressure-based solver, the **Non-Iterative Solver Relaxation Factors** define the explicit relaxation (Under-Relaxation of Variables in the Theory Guide) of variables between sub-iterations and are used to prevent the solution from diverging.

When **Pseudo Transient** is selected (available with the pressure-based coupled solver), the **Pseudo Transient Explicit Relaxation Factors** can be specified (see **Setting Pseudo Transient Explicit Relaxation Factors** (p. 1456)).
**Default**
sets the fields to their default values, as assigned by ANSYS Fluent.

**Equations...**
displays the Equations Dialog Box (p. 2210).

**Limits...**
displays the Solution Limits Dialog Box (p. 2211).

**Advanced...**
displays the Advanced Solution Controls Dialog Box (p. 2212).

**Set All Species URFs Together**
enables an option to use the same under-relaxation factors for all the species rather than setting each of the species individually. Notice that you will no longer see your list of individual species, instead a Species field will appear with the specified under-relaxation factor. Note that this option is available when species transport is enabled.

For additional information, see the following sections:
35.14.1. Equations Dialog Box
35.14.2. Solution Limits Dialog Box
35.14.3. Advanced Solution Controls Dialog Box

**35.14.1. Equations Dialog Box**

The Equations dialog box contains a list of the equations being solved for the current model. To temporarily disable solution of an equation, deselect it in this list and click OK. To re-enable the calculation for an equation, select it and click OK. See Step-by-Step Solution Processes (p. 1533) for details about using this feature in a step-by-step solution process.

Note that, when one of the density-based solvers is used, Energy will not appear as a separate item in the Equations list. For the density-based solvers the energy equation is included in the Flow category (which also includes the pressure and momentum equations).
35.14.2. Solution Limits Dialog Box

The **Solution Limits** dialog box allows you to improve the stability of the solution. See [Setting Solution Limits](p. 1440) for details about the items below.

![Solution Limits Dialog Box](image)

### Controls

- **Minimum Absolute Pressure, Maximum Absolute Pressure**
  set the limiting minimum and maximum allowable values for absolute pressure.

- **Minimum Static Temperature, Maximum Static Temperature**
  set the limiting minimum and maximum allowable values for temperature.

- **Minimum Turb. Kinetic Energy**
  sets the limiting minimum value of turbulent kinetic energy \( \langle k \rangle \) in the flow field. This parameter appears when one of the \( k-\varepsilon \) or \( k-\omega \) models or the RSM is used.

- **Minimum Turb. Dissipation Rate**
  sets the limiting minimum value of turbulent dissipation rate \( \langle e \rangle \) in the flow field. This parameter appears when one of the \( k-\varepsilon \) models or the RSM is used.

- **Minimum Spec. Dissipation Rate**
  sets the limiting minimum value of specific dissipation rate \( \langle \omega \rangle \) in the flow field. This parameter appears when one of the \( k-\omega \) models is used.

- **Maximum Turb. Viscosity Ratio**
  sets the limiting maximum allowable value of the ratio of turbulent to laminar viscosity \( \mu_t / \mu \). The turbulent viscosity is reduced to the necessary value so as not to exceed the maximum allowable viscosity ratio.

  This parameter appears for all turbulent flows.

- **Positivity Rate Limit**
  sets the limiting value for the rate of reduction of temperature. See [Adjusting the Positivity Rate Limit](p. 1441) for details.
This item appears only when one of the density-based solvers is used.

**Default**
sets the fields to their default values, as assigned by ANSYS Fluent. After execution, the Default button becomes the Reset button.

**Reset**
resets the fields to their most recently saved values (for example, the values before Default was selected). After execution, the Reset button becomes the Default button.

### 35.14.3. Advanced Solution Controls Dialog Box

The Advanced Solution Controls dialog box allows you to set parameters related to the multigrid, multi-stage, and non-iterative solvers.
Controls

Multigrid tab contains parameters related to the multigrid solver. See Modifying Algebraic Multigrid Parameters (p. 1535) and Setting FAS Multigrid Parameters (p. 1437) for details about the items below.

Cycle Type contains a drop-down list for each equation that is being solved. From this list you can select the multigrid cycle type (Flexible, V-Cycle, W-Cycle, or F-Cycle). See Specifying the Multigrid Cycle Type (p. 1432) for details.
Note that, for the density-based solvers, the Pressure, Momentum, and Energy equations will not appear individually. They will instead be grouped together and called Flow.

Furthermore, for the density-based explicit solver, the Cycle Type choices for the Flow equations will be limited to V-Cycle and W-Cycle, while the choices for Flow for the density-based implicit solver will be limited to V-Cycle and F-Cycle.

**Termination**

specifies the termination criterion for each equation that is being solved using algebraic multigrid. See Setting the Termination and Residual Reduction Parameters (p. 1432) for details.

**Restriction**

specifies the residual reduction criterion for each equation that is being solved using the Flexible algebraic multigrid cycle. See Setting the Termination and Residual Reduction Parameters (p. 1432) for details. (This item will not appear for an equation that is using a V-Cycle, W-Cycle, or F-Cycle.)

**AMG Method**

contains the drop-down list to choose between two AMG solvers: aggregative or selective. See Setting the AMG Method and the Stabilization Method (p. 1432) for details.

- **Aggregative**
  
enables aggregative AMG solver.

- **Selective**
  
enables selective AMG solver. The selective AMG solver is available only for scalar equations, and is not available in parallel ANSYS Fluent.

**Stabilization Method**

contains the drop-down list to choose the stabilization method.

- **BCGSTAB**
  
enables bi-conjugate gradient stabilized method.

- **RPM**
  
enables the recursive projection method. RPM stabilization is mainly used in conjunction with the coupled pressure-based solver.

- **CG**
  
enables the conjugate gradient method. CG stabilization is mainly used in conjunction with the segregated pressure-based solver.

**Algebraic Multigrid Controls**

contains parameters related to the algebraic multigrid solver. See Algebraic Multigrid (AMG) in the Theory Guide and Modifying Algebraic Multigrid Parameters (p. 1535) for details.

**Scalar and Coupled Parameters**

contain parameters that you can set. If you are using the density-based explicit solver or the pressure-based solver with any of the segregated schemes, described in Pressure-Velocity Coupling in the Theory Guide and Choosing the Pressure-Velocity Coupling Method (p. 1415), you will only set Scalar Parameters. If you are using the density-based implicit or the pressure-based coupled scheme, described in Coupled Algorithm, then you can set the Coupled Parameters.

**Fixed Cycle Parameters**

contains parameters that control the V, W, and F cycles. You can set the number of Pre-Sweeps and Post-Sweeps, and the Max Cycles. Normally one post-sweep is performed and
no pre-sweeps are done. See Fixed Cycle Parameters (p. 1434) for details about using the items below.

**Pre-Sweeps**
sets the number of sweeps to perform before moving to a coarser level.

**Post-Sweeps**
sets the number of sweeps to perform after coarser level corrections have been applied.

**Max Cycles**
sets the maximum number of V, W, or F cycles to be performed. The multigrid solver will continue to solve the set of equations until either the maximum number of cycles has been performed, or the **Termination** criteria are satisfied.

**Coarsening Parameters**
contains parameters that control the grouping of equations in the algebraic multigrid algorithm. See Coarsening Parameters (p. 1434) for details.

**Max Coarse Levels**
is the maximum number of coarse levels that will be built by the multigrid solver. Sets of coarser simultaneous equations are built until the maximum number of levels has been created, or the coarsest level has only 3 equations. Each level has about half as many unknowns as the previous level, so coarsening until there are only a few nodes left will require about as much total coarse-level coefficient storage as was required on the fine mesh. Reducing the maximum coarse levels will reduce the memory requirements, but may require more iterations to achieve a converged solution. Setting **Max Coarse Levels** to 0 turns off the multigrid solver.

**Coarsen by**
controls the number of equations on each successively coarser grid level. By default, this parameter is set to 2, indicating that the number of equations on each level will be 1/2 of the number on the previous level. In general, the number of equations on each coarser grid level will be equal to 1/ \( n \) of the number on the previous level, where \( n \) is the value set for the **Coarsen by** parameter.

**Conservative Coarsening**
enables the use of conservative coarsening techniques that can improve parallel performance and/or convergence for some difficult cases. This option is only available under **Coupled Parameters**.

**Laplace Coarsening**
enables the use of Laplace coefficients when grouping cells for coarsening.

**Smoother Type**
consist of two types:

**Gauss-Seidel**
is the simplest smoother type and is recommended when using the pressure-based segregated solver.

**ILU**
is more CPU intensive, but has better smoothing properties for block-coupled systems such as the pressure-based coupled solver and the density-based implicit solver.
**Flexible Cycle Parameters**
contains parameters that control the flexible multigrid cycle.

**Sweeps**
specifies the number of times to apply the smoothing method each time a relaxation is performed.

**Max Fine Relaxations**
sets the maximum number of relaxations to be performed on the Level 1 grid (fine grid level). This parameter eliminates the possibility that the Gauss-Seidel solver will get “stuck” on the fine grid level, unable to reduce the residuals by the fraction $(\alpha)$ required by the **Termination** criteria.

**Max Coarse Relaxations**
sets the maximum number of relaxations to be performed on each grid level above Level 1 (that is, the coarse grid levels). This parameter eliminates the possibility that the Gauss-Seidel solver will get “stuck” on a coarse grid level, unable to reduce the residuals on that level by the fraction $(\alpha)$ required by the **Termination** criteria. If the iterative solution on a given grid level is unable to meet the accuracy constraint of the **Termination** criteria, the correction equation will be deemed “converged” when this maximum number of relaxations on that grid level has been performed.

**Options**
contains additional multigrid parameters.

**Verbosity**
controls the amount of information that is printed out by the multigrid solver for monitoring purposes. See **Setting the Verbosity** (p. 1436) for details

**FAS Multigrid Controls**
contains parameters related to the FAS multigrid solver. See **Full-Approximation Storage (FAS) Multigrid** in the **Theory Guide** and **Setting FAS Multigrid Parameters** (p. 1437) for details. As noted in the title of this dialog box section, the FAS multigrid solver is used only for the **Flow** equations (pressure, momentum, and energy).

This section of the dialog box appears only when the density-based explicit solver is used.

**Fixed Cycle Parameters**
contains parameters that control the V, W, and F cycles of the FAS multigrid solver.

**Pre-Sweeps**
sets the number of iterations of the multi-stage solver to be performed on a given grid level before proceeding to a coarser grid level (the value of $\beta_1$ described in **Multigrid Cycles** in the **Theory Guide**). Typically, this is set to 1.

**Post-Sweeps**
sets the number of multigrid cycles to be performed on a given grid level before proceeding back up to the finer grid level (the value of $\beta_2$ described in **Multigrid Cycles** in the **Theory Guide**). A value of 1 results in V-cycle multigrid, and a value of 2 results in W-cycle multigrid.

**Coarsening Parameters**
contains parameters that control the grouping of cells in the FAS multigrid algorithm.
**Max Coarse Levels**
sets the maximum number of grid levels to be used in the multigrid process. A value of 0 disables multigrid (no coarse grid levels). If the coarse grids do not already exist, they are created automatically when you start iterating; you cannot create them by clicking the **OK** button. See [Turning On FAS Multigrid (p. 1429)] for details.

**Coarsen by**
controls the number of cells in each successively coarser grid level. By default, this parameter is set to 2, indicating that the number of cells on each level will be 1/2 of the number on the previous level. In general, the number of cells on each coarser grid level will be equal to \(1/\eta\) of the number on the previous level, where \(\eta\) is the value set for the **Coarsen by** parameter.

**Relaxation Factors**
are provided to moderate and stabilize the multigrid corrections.

**Courant Number Reduction**
sets the factor by which to reduce the Courant number for coarse grid levels (that is, every level except the finest). Some reduction of time step (such as the default 0.9) is typically required because the stability limit cannot be determined as precisely on the irregularly shaped coarser grid cells.

**Correction Reduction**
sets the factor by which to reduce the magnitude of the multigrid corrections transferred from one level to the next finer level. A typical value with \(\beta_1 = 1\) is 0.6. If two **Pre-Sweeps** and two **Post-Sweeps** are performed, this value can often be increased to 1.0 (that is, full correction transfer).

**Species Correction Reduction**
sets the factor by which to reduce the magnitude of the species corrections to stabilize the multigrid calculation. This item appears only when species transport is being modeled.

**Correction Smoothing**
sets the correction smoothing factor used to interpolate corrections from a coarser grid to a finer grid. For multigrid on structured meshes, corrections can be interpolated up to a finer mesh “smoothly” by using, for example, tri-linear interpolation. For unstructured meshes there is no analogous simple, algebraic procedure that can be used to interpolate without introducing substantial high frequency “noise”. Instead, the corrections are first interpolated, and then subjected to a smoothing pass. The default **Correction Smoothing** value of 0.5 should be acceptable for all cases; you should not need to change it.

**Options**
contains additional multigrid parameters.

**Verbosity**
controls the amount of information that is printed out by the multigrid solver for monitoring purposes.

**Multi-Stage**
tab allows you to set parameters that govern the operation of the multi-stage solver. It is available only when the density-based explicit solver is used. See [Changing the Multi-Stage Scheme (p. 1442)] for details about the items below.
Controls

Number of Stages

is the number of stages used in the multi-stage scheme. The default scheme is a 3-stage scheme with coefficients of 0.2075, 0.5915, and 1.0 for the first through third stages, respectively. Although the dialog box limits the maximum number of stages to five, you can define a scheme with an arbitrary number of stages with the solve/set/multi-stage text command.

Stage

labels the stage to which the parameters in the other columns apply.

Coefficient

sets the multi-stage coefficient for each stage. Coefficients should be greater than zero and less than one. The final stage should always have a coefficient of 1.

Dissipation

sets the stages for which artificial dissipation is evaluated. If a Dissipation box is selected for a particular stage, artificial dissipation will be updated on that stage. If not selected, artificial dissipation will remain “frozen” at the value of the previous stage.

Viscous

sets the stages for which viscous stresses are evaluated. If a Viscous box is selected for a particular stage, viscous stresses will be updated on that stage. If not selected, viscous stresses will remain “frozen” at the value of the previous stage. Viscous stresses should always be computed on the first stage, and successive evaluations will increase the “robustness” of the solution process, but will also increase the expense (that is, increase the CPU time per iteration). For steady problems, the final solution is independent of the stages on which viscous stresses are updated.

Default

sets the fields to their default values, as assigned by ANSYS Fluent. After execution, the Default button becomes the Reset button.
**Reset**

resets the fields to their most recently saved values (that is, the values before Default was selected). After execution, the Reset button becomes the Default button.

**Expert**

tab contains specialized parameters for limiting spatial discretization, as well as controls for the non-iterative solver.

![Advanced Solution Controls](image)

**Controls**

**Spatial Discretization Limiter**

contains controls for limiting the spatial discretization. See Selecting Gradient Limiters (p. 1444) for more information about limiters.

**Limiter Type**

selects the type of limiter applied to the spatial discretization: Standard, Multidimensional, or Differentiable.

**Cell to Face Limiting**

is where the limited value of the reconstruction gradient is determined at the cell face centers. This is the default method.

**Cell to Cell Limiting**

is where the limited value of the reconstruction gradient is determined along a scaled line between two adjacent cell centroids. On an orthogonal mesh (or when the cell-to-cell direction is parallel to face area direction), this method becomes equivalent to the default cell to face
method. For smooth field variation, cell to cell limiting may provide less numerical dissipation on meshes with skewed cells.

Apply Limiter Filter
enables the limiter filter. The limiter filter is only available with the Standard and Differentiable limiter types.

Pseudo Transient Method Usage
allows you to select and modify the parameters for each individual equation. See Setting Solution Controls for the Pseudo Transient Method (p. 1457) for details.

On/Off
enables/disables the equation-specific steady state solution method for a particular equation.

Under-Relaxation Factor
allows you to use the standard steady state method by turning off pseudo transient for that particular equation. Specify the corresponding under-relaxation factor to be employed with a particular equation.

Time Scale Factor
allows you to specify a factor that scales the pseudo time step employed for the flow equations specified in the Run Calculation task page. A time scale factor other than 1.0 (default) allows the use of an equation specific time step in lieu of using a uniform global pseudo time step.

Non-Iterative Solver Controls
contain parameters that control the sub-iterations for the individual equations. See Time-Advancement Algorithm in the Theory Guide for details.

Max. Corrections
provide control over the maximum number of sub-iterations for each individual equation.

Correction Tolerance
defines the overall accuracy.

Residual Tolerance
controls the solution of the linear equations.

Default
sets the fields to their default values, as assigned by ANSYS Fluent. After execution, the Default button becomes the Reset button.

Reset
resets the fields to their most recently saved values (that is, the values before Default was selected). After execution, the Reset button becomes the Default button.

35.15. Monitors Task Page

The Monitors task page allows you to set up tools for monitoring the convergence of your solution dynamically by checking residuals, statistics, force values, surface integrals, and volume integrals. See Monitoring Solution Convergence (p. 1477) for details.
Residuals, Statistic and Force Monitors

contains a listing of the monitors for your solution residuals, statistics, and/or force values

You can double-click an item in the list to open the corresponding dialog box, or you can select the item in the list and click the Edit... button.

Residuals

selecting this item and clicking the Edit... button opens the Residual Monitors Dialog Box (p. 2223).

Statistic

selecting this item and clicking the Edit... button opens the Statistic Monitors Dialog Box (p. 2225).
Create

provides a drop-down list that includes the following options: **Drag...**, **Lift...**, and **Moment...**. When clicked, these options open the Drag Monitor Dialog Box (p. 2226), Lift Monitor Dialog Box (p. 2229), and Moment Monitor Dialog Box (p. 2231), respectively.

**Edit...**

displays the dialog box corresponding to the selected item in the **Residuals, Statistic and Force Monitors** list.

**Surface Monitors**

contains a list of available surface monitors.

**Create**

opens the Surface Monitor Dialog Box (p. 2233) where you can create a new surface monitor.

**Edit**

opens the Surface Monitor Dialog Box (p. 2233) where you can edit an existing surface monitor.

**Delete**

removes the selected surface monitor(s) from the **Surface Monitors** list.

**Volume Monitors**

contains a list of available volume monitors.

**Create**

opens the Volume Monitor Dialog Box (p. 2235) where you can create a new volume monitor.

**Edit**

opens the Volume Monitor Dialog Box (p. 2235) where you can edit an existing volume monitor.

**Delete**

removes the selected volume monitor(s) from the **Volume Monitors** list.

**Convergence Monitors**

contains a list of convergence monitors.

**Convergence Manager**

opens the Convergence Manager Dialog Box (p. 2238) where you can set convergence conditions on the solution that are based on the values from surface, volume, lift, drag or moment monitors.

For additional information, see the following sections:

35.15.1. Residual Monitors Dialog Box
35.15.2. Statistic Monitors Dialog Box
35.15.3. Drag Monitor Dialog Box
35.15.4. Lift Monitor Dialog Box
35.15.5. Moment Monitor Dialog Box
35.15.6. Surface Monitor Dialog Box
35.15.7. Volume Monitor Dialog Box
35.15.8. Convergence Manager Dialog Box
35.15.9. Point Surface Dialog Box
35.15.10. Line/Rake Surface Dialog Box
35.15.11. Plane Surface Dialog Box
35.15.12. Quadric Surface Dialog Box
35.15.13. Iso-Surface Dialog Box
35.15.1. Residual Monitors Dialog Box

You can use the Residual Monitors dialog box to control the residual information that ANSYS Fluent reports. See Monitoring Residuals (p. 1478) for details about the items below.

Controls

Options
selects any combination of the following methods for reporting residuals. See Printing and Plotting Residuals (p. 1481) for details.

Print to Console
specifies whether or not to print residuals in the text window after each iteration.

Plot
specifies whether or not to plot residuals in the graphics window (with the window ID set in Window) after each iteration. See Plot Parameters (p. 1485) for details.

Window
sets the window ID in which the plot will be drawn. When ANSYS Fluent is iterating, the active graphics window is temporarily set to this window to update the residual plot, and then returned to its previous value. Thus, the residual plot can be maintained in a separate window that does not interfere with other graphical postprocessing.

Iterations to Plot
is the number of history points to display on the residual plot.

Axes...
opens the Axes Dialog Box (p. 2347), which allows you to modify the attributes of the axes.

Curves...
opens the Curves Dialog Box (p. 2349), which allows you to modify the attributes of the residual curves.
Iteration to Store
sets the number of residual history points to be stored in the data file. Due to the compaction algorithm used, saving 1000 points does not result in just the last 1000 iterations being saved; the history reaches back quite a bit further than that, but does not save a point at every iteration. Further back in the iteration history, the spacing between saved iterations grows larger. See Storing Residual History Points (p. 1481) for details.

Residual Values
controls the normalization and scaling of residuals. See Controlling Normalization and Scaling (p. 1482) for details.

Normalize
specifies whether or not to normalize the printed or plotted residual for each variable by the value indicated as the Normalization Factor for that variable. The default Normalization Factor is the maximum residual value after the first 5 iterations.

This option is off by default.

Iterations
sets the number of iterations for which ANSYS Fluent will search for the largest residual to normalize by. (If the Normalize option is turned off, this item will not be editable.)

Scale
specifies whether or not to print or plot scaled residuals for each variable. This option is on by default.

Compute Local Scale
computes and stores both the locally and globally scaled residuals from subsequent iterations, for the purpose of reporting. You will select the type of residual scaling from the Reporting Option drop-down list. See Definition of Residuals for the Pressure-Based Solver (p. 1478) and Definition of Residuals for the Density-Based Solver (p. 1479) for more information.

Reporting Option
gives you the choice of plotting or printing to the console the global scaling or local scaling of residuals.

Convergence Criterion
consists of four options that are available for checking an equation for convergence.

absolute
is the default and is available for steady-state cases. The residual (scaled and/or normalized) of an equation at an iteration is compared with a user-specified value. If the residual is less than the user-specified value, that equation is deemed to have converged for a time step.

relative
is where the residual of an equation at an iteration of a time step is compared with the residual at the start of the time step. If the ratio of the two residuals is less than a user-specified value, that equation is deemed to have converged for a time step.

relative or absolute
is where either the absolute convergence criterion or the relative convergence criterion is met. At that point, the equation is considered converged.

none
is used to disable convergence checking.
Residual
indicates the name of each variable for which residual information is available.

Monitor
indicates whether or not the residuals for each variable are to be monitored. You can toggle monitoring on and off for each variable by turning the corresponding check box in the Monitor list on or off.

Normalization Factor
shows the normalization factor for each variable. The default is the maximum residual value after the first 5 iterations. To set this value manually, enter a new value in the corresponding Normalization Factor field. This list will not appear if the Normalize option is turned off.

Check Convergence
indicates whether or not the convergence of each variable is to be monitored. If convergence is being monitored, the solution will stop automatically when each variable meets its specified convergence criterion. You can check convergence only for variables for which you are monitoring residuals. You can toggle convergence checking on and off for each variable by turning the corresponding check box in the Check Convergence list on or off.

Absolute Criteria, Relative Criteria
shows the residual value for which the solution of each variable will be considered to be converged. To set this value manually, enter a new value in the corresponding Absolute Criteria/Relative Criteria field.

Plot
displays the current residual history plot.

Renormalize
sets the normalization factors to the maximum values in the residual histories. Renormalize should be used to renormalize the residual plot in cases where the maximum residuals occur sometime after the first five iterations.

35.15.2. Statistic Monitors Dialog Box
You can use the Statistic Monitors dialog box to control the statistics information that ANSYS Fluent reports. See Monitoring Statistics (p. 1486) for details about using this dialog box.

Controls

Options
selects the following methods for reporting statistics:
**Print to Console**
specifies whether or not to print the selected statistics in the console window after each iteration.

**Plot**
specifies whether or not to plot each of the selected statistics in a separate graphics window after each iteration. The windows that the plots appear in are determined by the First Window option below.

**Statistics**
contains a list of statistics from which you can select those that are to be plotted. The availability of per/pr-grad is restricted to specified-mass-flow periodic flow calculations while per/bulk-temp-ratio is available only for specified-mass-flow periodic heat transfer calculations. Similarly, time and delta_time are available only if you are modeling unsteady flow.

**Window**
sets the window ID for the plot of the first statistic selected. The remaining selected statistics will be plotted in windows with incrementally higher IDs.

**Axes...**
opens the Axes Dialog Box (p. 2347) to modify the attributes of the axes.

**Curves...**
opens the Curves Dialog Box (p. 2349) to modify the attributes of the data curves.

### 35.15.3. Drag Monitor Dialog Box

You can use the Drag Monitor dialog box to create monitors that save the convergence history of the drag coefficient on specified wall zones. See Monitoring Force and Moment Coefficients (p. 1487) for details about using this dialog box.
Controls

Name
  specifies the name of the monitor, which will be displayed in the Residuals, Statistic and Force Monitors selection list of the Monitors task page.

Options
  selects one of the following methods for reporting the selected coefficient:

  Print to Console
    specifies whether or not to print the selected coefficient in the console window after each iteration.

  Plot
    specifies whether or not to plot the selected coefficient in the graphics window (with the ID set in Window) after each iteration.

  Window
    sets the window ID in which the plot will be drawn. When ANSYS Fluent is iterating, the active graphics window is temporarily set to this window to update the force monitoring plots, and then returned to its previous value. Thus, the force coefficient plots can be maintained in separate windows that do not interfere with other graphical postprocessing.

  Axes...
    opens the Axes Dialog Box (p. 2347) to modify the attributes of the axes.
Curves... opens the Curves Dialog Box (p. 2349) to modify the attributes of the data curves.

Write specifies whether or not to write the selected coefficient data to a file (with the name in File Name) after each iteration.

Important
If you choose not to save the force coefficient data in a file, this information will be lost when you exit the current ANSYS Fluent session.

File Name specifies the name of the file to which the force data is written (if you are using the Write option).

Per Zone specifies whether or not the forces or moments for multiple walls should be monitored on each wall separately. When this option is turned off (the default), ANSYS Fluent will compute and monitor the total force for all of the selected walls combined together.

Average Over (Iterations), Average Over (Time Steps) specifies how ANSYS Fluent will calculate and display the selected coefficient. If you specify an integer greater than the default (1), ANSYS Fluent will calculate a running average over the number of Iterations (steady state) or Time Steps (transient) that you specify.

Force Vector contains the components of the force vector.

X,Y,Z are the components of the force vector along which the forces will be computed.

Save Output Parameter... (available when a wall zone is selected) opens the Save Output Parameter Dialog Box (p. 2372) where you can save the drag coefficient as an output parameter. The value of this parameter will depend on the selected wall zones and the force vector.

Wall Zones contains a selectable list of wall zones on which the selected coefficient is computed. If you are monitoring more than one coefficient, the list of selected wall zones is often the same for each coefficient. If you want, however, you can have each coefficient computed on a different list of zones.

Highlight Zones when enabled highlights the zone (selected in the Drag Monitor dialog box) in the graphics window.

Plot displays an XY plot of the convergence history of the selected force.

Clear discards the force-monitoring data, including associated files. Each of these actions must be confirmed in a Question Dialog Box (p. 15).
35.15.4. Lift Monitor Dialog Box

You can use the Lift Monitor dialog box to create monitors that save the convergence history of the lift coefficient on specified wall zones. See Monitoring Force and Moment Coefficients (p. 1487) for details about using this dialog box.

Controls

Name
specifies the name of the monitor, which will be displayed in the Residuals, Statistic and Force Monitors selection list of the Monitors task page.

Options
selects one of the following methods for reporting the selected coefficient:

Print to Console
specifies whether or not to print the selected coefficient in the console window after each iteration.

Plot
specifies whether or not to plot the selected coefficient in the graphics window (with the ID set in Window) after each iteration.

Window
sets the window ID in which the plot will be drawn. When ANSYS Fluent is iterating, the active graphics window is temporarily set to this window to update the force monitoring plots, and then
returned to its previous value. Thus, the force coefficient plots can be maintained in separate windows that do not interfere with other graphical postprocessing.

**Axes...**
opens the Axes Dialog Box (p. 2347) to modify the attributes of the axes.

**Curves...**
opens the Curves Dialog Box (p. 2349) to modify the attributes of the data curves.

**Write**
specifies whether or not to write the selected coefficient data to a file (with the name in **File Name**) after each iteration.

---

**Important**
If you choose not to save the force coefficient data in a file, this information will be lost when you exit the current ANSYS Fluent session.

**File Name**
specifies the name of the file to which the force data is written (if you are using the **Write** option).

**Per Zone**
specifies whether or not the forces or moments for multiple walls should be monitored on each wall separately. When this option is turned off (the default), ANSYS Fluent will compute and monitor the total force for all of the selected walls combined together.

**Average Over (Iterations), Average Over (Time Steps)**
specifies how ANSYS Fluent will calculate and display the selected coefficient. If you specify an integer greater than the default (1), ANSYS Fluent will calculate a running average over the number of **Iterations** (steady state) or **Time Steps** (transient) that you specify.

**Force Vector**
contains the components of the force vector.

**X,Y,Z**
are the components of the force vector along which the forces will be computed.

**Save Output Parameter...**
(available when a wall zone is selected) opens the Save Output Parameter Dialog Box (p. 2372) where you can save the lift coefficient as an output parameter. The value of this parameter will depend on the selected wall zones and the force vector.

**Wall Zones**
contains a selectable list of wall zones on which the selected coefficient is computed. If you are monitoring more than one coefficient, the list of selected wall zones is often the same for each coefficient. If you want, however, you can have each coefficient computed on a different list of zones.

**Highlight Zones**
when enabled highlights the zone (selected in the **Lift Monitor** dialog box) in the graphics window.

**Plot**
displays an XY plot of the convergence history of the selected force.
Clear
discards the force-monitoring data, including associated files. Each of these actions must be confirmed in a Question Dialog Box (p. 15).

35.15.5. Moment Monitor Dialog Box

You can use the Moment Monitor dialog box to create monitors that save the convergence history of the moment coefficient on specified wall zones. See Monitoring Force and Moment Coefficients (p. 1487) for details about using this dialog box.

Controls

Name
specifies the name of the monitor, which will be displayed in the Residuals, Statistic and Force Monitors selection list of the Monitors task page.

Options
selects one of the following methods for reporting the selected coefficient:

Print to Console
specifies whether or not to print the selected coefficient in the console window after each iteration.
Plot specifies whether or not to plot the selected coefficient in the graphics window (with the ID set in Window) after each iteration.

Window sets the window ID in which the plot will be displayed. When ANSYS Fluent is iterating, the active graphics window is temporarily set to this window to update the force monitoring plots, and then returned to its previous value. Thus, the force coefficient plots can be maintained in separate windows that do not interfere with other graphical postprocessing.

Axes... opens the Axes Dialog Box (p. 2347) to modify the attributes of the axes.

Curves... opens the Curves Dialog Box (p. 2349) to modify the attributes of the data curves.

Write specifies whether or not to write the selected coefficient data to a file (with the name in File Name) after each iteration.

---

**Important**

If you choose not to save the force coefficient data in a file, this information will be lost when you exit the current ANSYS Fluent session.

---

File Name specifies the name of the file to which the force data is written (if you are using the Write option).

Per Zone specifies whether or not the moments for multiple walls should be monitored on each wall separately. When this option is turned off (the default), ANSYS Fluent will compute and monitor the total moment for all of the selected walls combined together.

**Average Over (Iterations), Average Over (Time Steps)** specifies how ANSYS Fluent will calculate and display the selected coefficient. If you specify an integer greater than the default (1), ANSYS Fluent will calculate a running average over the number of Iterations (steady state) or Time Steps (transient) that you specify.

Moment Center contains the Cartesian coordinates of the moment center.

\[X,Y,Z\]

are the Cartesian coordinates of the moment center about which moments will be computed.

Moment Axis contains the Cartesian coordinates of the moment vector to be monitored. For two-dimensional flows, only the moment vector about the \(z\)-coordinate axis exists. Presently, you can monitor only one component of the moment vector at a time.

Save Output Parameter... (available when a wall zone is selected) opens the Save Output Parameter Dialog Box (p. 2372) where you can save the drag coefficient as an output parameter. The value of this parameter will depend on the selected wall zones, the moment center, and the moment axis.
Wall Zones
contains a selectable list of wall zones on which the selected coefficient is computed. If you are monitoring more than one coefficient, the list of selected wall zones is often the same for each coefficient. If you want, however, you can have each coefficient computed on a different list of zones.

Highlight Zones
when enabled highlights the zone (selected in the Moment Monitor dialog box) in the graphics window.

Plot
displays an XY plot of the convergence history of the selected moment coefficient.

Clear
discards the force-monitoring data, including associated files. Each of these actions must be confirmed in a Question Dialog Box (p. 15).

35.15.6. Surface Monitor Dialog Box
The Surface Monitor dialog box allows you to save the convergence history of the average, integral, flow rate, or mass average (among other quantities) of a field variable on one or more surfaces. You can also use the Surface Monitor dialog box define what each surface monitor is tracking. See Monitoring Surface Integrals (p. 1493) for details about the items below.

Controls
Name
specifies the name of the surface monitor.
Options
contains parameters used in saving monitor data.

Print to Console
specifies whether or not to print the data from each surface monitor in the console window.

Plot
specifies whether or not to plot the data from each surface monitor in the graphics window.

Window
sets the window ID in which the plot will be drawn. When ANSYS Fluent is iterating, the active graphics window is temporarily set to this window to update the surface monitoring plot, and then returned to its previous value. Thus, the surface monitor plot can be maintained in a separate window that does not interfere with other graphical postprocessing.

Curves...
opens the Curves Dialog Box (p. 2349) to modify the attributes of the data curves.

Axes...
opens the Axes Dialog Box (p. 2347) to modify the attributes of the axes.

Write
specifies whether or not to write the data from each surface monitor to a file.

---

Important
If you choose not to save the surface integration data in a file, this information will be lost when you exit the current ANSYS Fluent session.

---

File Name
specifies the name of the file to which the surface data is written.

X Axis
specifies the x-axis function against which monitored data will be plotted or written. Available options are Iteration, Time Step, and Flow Time (elapsed time).

Get Data Every
indicates the frequency at which you want to plot, print, or write the surface monitor. A default value of 1 will allow you to monitor at every Iteration or Time Step. Time Step is a valid choice only if you are calculating unsteady flow. See Overview of Defining Surface Monitors (p. 1493) for details.

Average Over
specifies how ANSYS Fluent will calculate and display the selected variable. If you specify an integer greater than the default (1), ANSYS Fluent will calculate a running average over the number of iterations (steady state) or time steps (transient) that you specify.

Report Type
selects the integration method used on the selected surfaces. The available report types are the same as those in the Surface Integrals Dialog Box (p. 2356). See Surface Integration (p. 1755) for details.

Field Variable
contains a list of solution variables that can be monitored on the selected surfaces. This list will be deactivated if you select Mass Flow Rate or Volume Flow Rate as the Report Type.
Phase
contains a list of all of the phases in the problem that you have defined. This is available when the VOF, mixture, or Eulerian multiphase model is enabled.

Surfaces
contains a selectable list of the current surfaces.

New Surface
is a drop-down list button that contains a list of surface options:

Point
opens the Point Surface Dialog Box (p. 2239).

Line/Rake
opens the Line/Rake Surface Dialog Box (p. 2240).

Plane
opens the Plane Surface Dialog Box (p. 2241).

Quadric
opens the Quadric Surface Dialog Box (p. 2243).

Iso-Surface
opens the Iso-Surface Dialog Box (p. 2245).

Iso-Clip
opens the Iso-Clip Dialog Box (p. 2246).

Save Output Parameter...
opens the Save Output Parameter Dialog Box (p. 2372).

35.15.7. Volume Monitor Dialog Box
You can use the Volume Monitor dialog box to save the convergence history of the volume, sum, volume integral, mass integral, volume average, or mass average of a field variable on one or more cell zones. You can also define what each volume monitor is tracking. See Monitoring Volume Integrals (p. 1496) for details about the items below.
Controls

Name
specifies the name of the volume monitor.

Options
contains parameters used in saving monitor data.

Print to Console
specifies whether or not to print the data from each volume monitor in the console window.

Plot
specifies whether or not to plot the data from each volume monitor in the graphics window.

Window
sets the window ID in which the plot will be drawn. When ANSYS Fluent is iterating, the active graphics window is temporarily set to this window to update the volume monitoring plot, and then returned to its previous value. Thus, the volume monitor plot can be maintained in a separate window that does not interfere with other graphical postprocessing.

Curves...
opens the Curves Dialog Box (p. 2349) to modify the attributes of the data curves.

Axes...
opens the Axes Dialog Box (p. 2347) to modify the attributes of the axes.
Write
specifies whether or not to write the data from each volume monitor to a file.

Important
If you choose not to save the volume integration data in a file, this information will be lost when you exit the current ANSYS Fluent session.

File Name
specifies the name of the file to which the volume monitor data is written.

X Axis
specifies the x-axis function against which monitored data will be plotted or written. Available options are Iteration, Time Step, and Flow Time (elapsed time).

Get Data Every
indicates the frequency at which you want to plot, print, or write the volume monitor. A default value of 1 will allow you to monitor at every Iteration or Time Step. Time Step is a valid choice only if you are calculating unsteady flow. See Overview of Defining Surface Monitors (p. 1493) for details.

Average Over
specifies how ANSYS Fluent will calculate and display the selected variable. If you specify an integer greater than the default (1), ANSYS Fluent will calculate a running average over the number of iterations (steady state) or time steps (transient) that you specify.

Report Type
selects the integration method used on the selected cell zones. The available report types are the same as those in the Volume Integrals Dialog Box (p. 2359). See Volume Integration (p. 1758) for details.

Field Variable
contains a list of solution variables that can be monitored on the selected cell zones. This list will be deactivated if you select Volume as the Report Type.

Phase
contains a list of all of the phases in the problem that you have defined. This is available when the VOF, mixture, or Eulerian multiphase model is enabled.

Cell Zones
contains a selectable list of the current cell zones.

Save Output Parameter...
opens the Save Output Parameter Dialog Box (p. 2372).
35.15.8. Convergence Manager Dialog Box

The convergence manager facility allows you to set convergence conditions on the solution based on the values from surface, volume, lift, drag or moment monitors. See Convergence Manager (p. 1499) for details on setting up the Convergence Manager dialog box.

Note

If you are solving a transient case, the Convergence Manager dialog box will relabel some fields since the transient case uses time-steps rather than iterations. These alternate labels are indicated below.

Controls

Active
activates the monitors. Select the check box to the left of a monitor name to activate it.

Monitor Name
designates the name of the monitor.

Stop Criterion
specifies the criterion below which the solution is considered to be converged.

Initial Iterations to Ignore | Initial Time-Steps to Ignore
ignores the first few iterations/time-steps if you expect the solution to fluctuate initially.

Previous Iterations to Consider | Previous Time-Steps to Consider
specifies the number of previous iterations/time-steps to be included in the monitor convergence check.

Average Over
indicates how many iterations (steady state) or time steps (transient) the running average is calculated over for the selected coefficient.
Choose Condition
to select the convergence conditions.

**All Conditions are Met**
The solution is considered to be converged if all of the active monitors’ criteria are satisfied.

**Any Condition is Met**
The solution is considered to be converged if any of the active monitors’ criteria is satisfied.

**Every Iteration | Every Time-Step**
to select how often convergence checks are done.

### 35.15.9. Point Surface Dialog Box

The **Point Surface** dialog box allows you to interactively create point surfaces (surfaces containing a single data point). See [Point Surfaces (p. 1583)](#) for details about the items below.

![Point Surface Dialog Box](image)

#### Controls

**Options** contains options related to the point tool. See [Using the Point Tool (p. 1585)](#) for details about using this feature.

**Point Tool**
activates the point tool.

**Reset**
resets the point tool to its default position.

**Coordinates**
designates the coordinates of the point in the surface \((x_0, y_0, z_0)\).

**Select Point with Mouse**
activates the selection of the point with the mouse. You can select a point by clicking on a location in the active window with the mouse-probe button. (See [Controlling the Mouse Button Functions (p. 1654)](#) for information about setting mouse button functions.)
New Surface Name
designates the name of the new surface. The default is the concatenation of the surface type and an integer which is the new surface ID.

Create
creates the surface.

Manage...
opens the Surfaces Dialog Box (p. 2248) in which you can rename and delete surfaces and determine their sizes.

35.15.10. Line/Rake Surface Dialog Box

The Line/Rake Surface dialog box allows you to interactively create line and rake surfaces. A rake is a linear, uniform distribution of points between two endpoints. See Line and Rake Surfaces (p. 1586) for details about the items below.

**Controls**

**Options** contains options related to the line tool. See Using the Line Tool (p. 1587) for details about using this feature.

**Line Tool** activates the line tool.

**Reset** resets the line tool to its default position.

**Type** selects line or rake as the surface to be created.
**Number of Points**

defines the number of points in the rake surface (inactive for line surfaces).

**End Points**
designates the coordinates of the first point \((x_0, y_0, z_0)\) and the last point \((x_1, y_1, z_1)\).

**Select Points with Mouse**
activates the selection of endpoints with the mouse. You can select endpoints by clicking on locations in the active window with the mouse-probe button. (See **Controlling the Mouse Button Functions** (p. 1654) for information about setting mouse button functions.)

**New Surface Name**
designates the name of the new surface. The default is the concatenation of the surface type and an integer which is the new surface ID.

**Create**
creates the surface.

**Manage...**
opens the **Surfaces Dialog Box** (p. 2248) in which you can rename and delete surfaces and determine their sizes.

### 35.15.11. Plane Surface Dialog Box

The **Plane Surface** dialog box allows you to interactively create a planar surface that cuts through the domain. See **Plane Surfaces** (p. 1589) for details about the items below.

![Plane Surface Dialog Box](image)

**Options**

- Aligned with Surface
- Aligned with View Plane
- Point and Normal
- Bounded
- Sample Points
- Plane Tool

**Sample Density**

- Edge 1: 1
- Edge 2: 1

**Surfaces**
- default-interior
- pressure-outlet-7
- symmetry
- velocity-inlet-5
- velocity-inlet-6
- wall
- z=0_outlet

**Points**

<table>

</tbody>
</table>
Controls

Options
contains options for defining the plane surface.

Aligned with Surface
enables the specification of a plane parallel to an existing surface.

Aligned with View Plane
enables the specification of a plane parallel to the current view in the active graphics window.

Point and Normal
enables the specification of a plane having a certain normal vector and passing through a specified point.

Bounded
enables the creation of a bounded parallelepiped, 3 of whose 4 corners are the 3 points that define the plane equation (or the 4 corners of the Plane Tool).

Sample Points
enables the specification of a point density along the 2 directions (of the parallelepiped). This creates a uniformly distributed set of points on the plane. (This item is available only when the Bounded option is enabled.)

Plane Tool
activates the plane tool. See Using the Plane Tool (p. 1591) for details. This option is not available if you are using the Aligned With Surface or Aligned With View Plane option.

Sample Density
specifies the density of points when the Sample Points option is enabled.

Edge 1, Edge 2
sets the point density along the two directions of the plane. (Edge 1 extends from point 0 to point 1, and edge 2 extends from point 1 to point 2.)

Select Points
activates the selection of points with the mouse. You can select endpoints by clicking on locations in the active window with the mouse-probe button. (See Controlling the Mouse Button Functions (p. 1654) for information about setting mouse button functions.)

Reset Points
resets the plane tool to its default position.

Surfaces
contains a list of currently defined surfaces. If you choose the Aligned With Surface option, this will become a selectable list, and you can choose the surface that you want the new plane surface to be aligned with.

Points
contains boxes in which you can set the coordinates of the three points defining the planar surface.

x0, y0, z0
designates the coordinates of the first point.

\[x_1, y_1, z_1\]

designates the coordinates of the second point.

\[x_2, y_2, z_2\]

designates the coordinates of the third point.

**Normal**
contains boxes in which you can specify the components of the normal vector when the Point And Normal option is enabled.

\[i_x, i_y, i_z\]

designates the coordinates of the end point of the normal vector (the start point being 0, 0, 0).

**New Surface Name**
designates the name of the new surface. The default is the concatenation of the surface type and an integer which is the new surface ID.

**Create**
creates the surface.

**Manage...**
opens the Surfaces Dialog Box (p. 2248) in which you can rename and delete surfaces and determine their sizes.

### 35.15.12. Quadric Surface Dialog Box

The Quadric Surface dialog box allows you to interactively define quadric functions and create surfaces from them. Lines and circles are commonly used types of quadric functions, so additional support is provided for defining them. See Quadric Surfaces (p. 1593) for details about using the items below.

---

**Important**

Note that your inputs for the quadric function must be in SI units.

![Quadric Surface Dialog Box](image)
Controls

Type
selects the type of quadric function. Presently, you may select **Line/Plane**, **Circle/Sphere** or a general **Quadric**. Some of the control buttons take on different meanings for each of the three quadric function types.

**Line/Plane**
specifies that the surface will consist of all points on the domain that satisfy the equation

\[ ix * x + iy * y + iz * z = \text{distance}, \]

where

- **ix** is the coefficient of \( x \) in the quadric function.
- **iy** is the coefficient of \( y \) in the quadric function.
- **iz** is the coefficient of \( z \) in the quadric function.

**distance**
is the distance of the line/plane from the origin.

When you click the **Update** button in **Quadric Function**, the coefficients in the quadric function will change to reflect your inputs.

**Circle/Sphere**
specifies that the surface will consist of all points in the domain that satisfy the equation

\[ (x - x0)^2 + (y - y0)^2 + (z - z0)^2 = r^2, \]

where

- **x0, y0, z0** are the \( x, y, z \) coordinates of the center.
- **r** is the radius.

When you click the **Update** button in **Quadric Function**, the coefficients in the quadric function will change to reflect your inputs.

**Quadric**
specifies that the surface will consist of all points in the domain that satisfy the quadric function

\[ Q = \text{value}, \]

where \( Q \) is the quadric function you define as shown below. You will enter **value** to the right of the **Type** entry, but the coefficients in the quadric function are entered directly in the **Quadric Function** box. Note that in 2D problems the \( z \) entries are ignored.

- **x2, y2, z2, xy, yz, zx, x, y, z**
  are the coefficients of the corresponding terms in the quadric function.

**Quadric Function**
contains the display of the quadric function and the **Update** button. If you select **Line/Plane** or **Circle/Sphere** as the **Type**, the coefficients of the quadric function will be updated here when you click the **Update** button. You will not be able to edit the values in the **Quadric Function** box directly. If you
select **Quadric** as the **Type**, you will enter the coefficients directly in this box, and the **Update** button will be inactive.

**Update**
updates the coefficients in **Quadric Function** to reflect the current input.

**New Surface Name**
designates the name of the new surface. The default is the concatenation of the surface type and an integer which is the new surface ID.

**Create**
creates the surface.

**Manage...**
opens the **Surfaces Dialog Box** (p. 2248) in which you can rename and delete surfaces and determine their sizes.

### 35.15.13. Iso-Surface Dialog Box

The **Iso-Surface** dialog box allows you to interactively create isosurfaces. These surfaces can be isovaled sections of an existing surface or of the entire domain. For more effective use of the slider bar, press the **Compute** button before using it. See **Isosurfaces** (p. 1595) for details about the items below.

**Controls**

**Surface of Constant**
contains a list from which you can select the scalar field which will be used for isosurfacing.

**Min**
displays the minimum field value, which is computed when you click **Compute**.

**Max**
displays the maximum field value, which is computed when you click **Compute**.
Iso-Values
sets user-specified isovalues. There are two ways you can set the Iso-Values:

- You can set an isovalue interactively by moving the slider with the left mouse button. This will also create a temporary isosurface in the graphics window. Using the slider allows you to preview the isosurfaces before defining them. Note: Even though the isosurface is displayed, it is only a temporary surface. To create an isosurface, use the Create button after deciding on a particular isovalue.

- You can type in isovalues in the Iso-Values field directly, separating multiple values by white space. Multiple isovalues will be contained in a single isosurface; that is, you cannot select subsurfaces within the resulting isosurface.

From Surface
contains a list of existing surfaces from which you can select the surface to be used for isosurfacing. If you do not select a surface from the list, the isosurfacing will be performed on the entire domain.

From Zones
contains a list of cell zones from which you can select the zone for creating an isosurface.

New Surface Name
designates the name of the surface to be created. The default is the concatenation of the scalar field name and an integer which is the new surface ID.

Create
creates the surface.

Compute
computes the minimum and maximum of the scalar field across the domain and displays them in the Min and Max boxes.

Manage...
opens the Surfaces Dialog Box (p. 2248) in which you can rename and delete surfaces and determine their sizes.

35.15.14. Iso-Clip Dialog Box
The Iso-Clip dialog box allows you to interactively clip surfaces. The clipped surface consists of those points on the selected surface where the scalar field values are within the specified range. See Clipping Surfaces (p. 1597) for details about the items below.
Controls

Clip to Values of
contains a list from which you can select the scalar field to be used for clipping.

Phase
allows you to select the phase when one of the multiphase models is selected in the Multiphase Model Dialog Box (p. 1899).

Min, Max
set the minimum and maximum values in the clipping range. There are two ways you can set the Min and Max:

- You can set a value interactively by moving the indicator in the dial above the Min or Max field with the left mouse button. This will also create a temporary surface in the graphics window. Using the dial allows you to preview the clipped surfaces before defining them. Note: Even though the clipped surface is displayed, it is only a temporary surface. To clip the surface, use the Clip button after deciding on the minimum and maximum values.

- You can type in values in the Min and Max fields directly.

Clip Surface
contains a list of surfaces from which you can select the surface to be clipped. You must select a surface to activate the Clip push button.

New Surface Name
designates the name of the surface to be created. The default is the concatenation of the surface type and an integer which is the new surface ID.

Clip
creates the clipped surface. (The original surface will remain unchanged.)

Compute
computes the minimum and maximum values of the scalar field across the domain, and displays them in the Min and Max boxes.
Manage... opens the Surfaces Dialog Box (p. 2248) in which you can rename and delete surfaces and determine their sizes.

35.15.15. Surfaces Dialog Box

The Surfaces dialog box allows you to interactively group, rename, and delete surfaces and obtain information about their components. See Grouping, Renaming, and Deleting Surfaces (p. 1601) for details about the items below.

Controls

Surfaces contains a list of existing surfaces from which you can select the surface(s) of interest.

Name displays the name of the selected surface. You can edit the text field to modify the surface name. (If more than one surface is selected, the name of the first one you selected will be displayed.)

Surface Type displays the type of surface that is selected (for example, zone-surf if one surface is selected, or Multiple Surfaces if more than one surface is selected).

Points, 0D Facets, 1D Facets, and 2D Facets display the number of points and facets in the selected surface. If more than one surface is selected, the sum over all selected surfaces is displayed for each quantity.

Note that if you want to check these statistics for a surface that was read from a case file, you will need to first display it.

Highlight Surfaces when enabled highlights the surfaces (selected in the Surfaces dialog box) in the graphics window.

ID displays the ID of the selected surface. You cannot change this value.
UnGroup
ungroups the selected surface. This button is available only if the selected surface was created by
Grouping two or more surfaces together.

Rename
renames the selected surface in Surfaces with the name specified in Name. This button is available
when just one surface is selected. (If two or more surfaces are selected, it becomes the Group button.)

Group
groups two or more selected surfaces and gives the group the name entered in Name. This button replaces
the Rename button when two or more surfaces are selected.

Delete
deletes the selected surface(s).

35.16. Solution Initialization Task Page

The Solution Initialization task page allows you to define values for flow variables and initialize the
flow field to these values. See for details about using this dialog box.
### Controls

**Initialization Method**
allows you to choose between **Hybrid Initialization** and **Standard Initialization**.

**Hybrid Initialization**
is a collection of boundary interpolation methods, where variables, such as temperature, turbulence, species fractions, volume fractions, and so on, are automatically patched based on domain averaged values or a particular interpolation recipe (see **Hybrid Initialization (p. 1451)**).

**Standard Initialization**
allows you to define values for flow variables and initialize the flow field to these values.

**Compute from**
is a drop-down list of zones; the default values for applicable variables will be computed from information contained in the zone that you select from this list. The computation will occur when you select the required zone, and the variable values will be displayed in **Initial Values**. You can also choose the **all-zones** item in this list to compute average values based on all zones.

<table>
<thead>

</table>
Reference Frame
indicates whether the initial velocities are absolute velocities (Absolute) or velocities relative to the
motion of each cell zone (Relative to Cell Zone). This selection is necessary only if your problem involves
moving reference frames or sliding meshes. If there is no zone motion, both options are equivalent.

Initial Values
displays the initial values of applicable variables. You can use Compute from to compute values from
a particular zone, or you can enter values directly.

Initialize
initializes the entire flow field to the values listed.

Reset
resets the fields to their "saved" values.

Patch...
opens the Patch Dialog Box (p. 2251).

Reset DPM Sources
allows you to reset the interphase sources/sinks of momentum, heat, and/or mass to zero. This item is
available when you perform coupled discrete phase calculations. See Resetting the Interphase Exchange
Terms (p. 1209) for details.

Reset Statistics
can be used to both initialize the flow statistics and reset the flow statistics after you have gathered
some data for time statistics. This item is available when you perform unsteady calculations and have
enabled the Data Sampling for Time Statistics option in the Run Calculation Task Page (p. 2269). See
User Inputs for Time-Dependent Problems (p. 1463) for details.

More Settings...
opens the Hybrid Initialization Dialog Box (p. 2253). This button is available only when Hybrid Initialization
is the selected method.

For additional information, see the following sections:
35.16.1. Patch Dialog Box
35.16.2. Hybrid Initialization Dialog Box

35.16.1. Patch Dialog Box

The Patch dialog box allows you to patch different values of flow variables into different cells. See
Patching Values in Selected Cells (p. 1447) for details about using this feature.
**Controls**

**Reference Frame**
indicates whether patched velocities are absolute velocities (Absolute) or velocities relative to the motion of each cell zone (Relative to Cell Zone). This selection is necessary only if your problem involves moving reference frames or sliding meshes. If there is no zone motion, both options are equivalent. Also, this selection affects only velocities, so the options will not be available unless you have selected a velocity in the Variable list.

**Phase**
contains a list of all of the phases in the problem that you have defined. This is available when the VOF, mixture, or Eulerian multiphase model is enabled.

**Variable**
contains a list of flow variables from which you can choose the variable to be patched.

**Value**
sets a constant value to be patched for the selected Variable.

**Use Field Function**
enables the patching of a custom Field Function, rather than a constant Value, for the selected Variable. See Using Field Functions (p. 1449) for details.

**Field Function**
contains a list of defined custom field functions. If the Use Field Function option is enabled, you can patch one of these functions for the selected Variable. See Using Field Functions (p. 1449) for details.

**Zones to Patch**
contains a list of cell zones. The specified Value or Field Function for the selected Variable will be patched into the zones you select from this list.

**Registers to Patch**
contains a list of cell registers that have been created using the adaption tools. You can patch a different value for a group of cells within a single cell zone by selecting a register containing a subset of the cells in the zone. See Using Registers (p. 1449) for details.
Patch updates the flow-field data based on the inputs above.

35.16.2. Hybrid Initialization Dialog Box

The **Hybrid Initialization** dialog box contains a host of adjustable settings that control the **Hybrid Initialization** strategy.

![Hybrid Initialization Dialog Box]

**Controls**

**General Settings**

allow you to adjust such entries as the number of iterations and under-relaxation factors.

**Number of Iterations**

uses a default value of 10. This is the number of iterations that will be performed while solving the Laplace equations to initialize the velocity and pressure. If the initialized velocity and pressure fields are not to your liking, you may want to increase the number of iterations and re-initialize the solution.

**Explicit Under-Relaxation Factor**

uses a default value of 1. This value will be used while solving the Laplace equation to initialize the velocity and pressure. If the initialized velocity and pressure fields are not to your liking, you may want to adjust the under-relaxation factor and re-initialize the solution.

**Reference Frame**

indicates whether the initial velocities are absolute velocities (**Absolute**) or velocities relative to the motion of each cell zone (**Relative to Cell Zone**). This selection is necessary only if your problem involves moving reference frames or sliding meshes. If there is no zone motion, both options are equivalent.
Initialization Options
allows you to include any of the three initialization options.

Use Specified Initial Pressure on Inlets
if you want the specified pressure for Supersonic/Initialization Gauge Pressure at the inlet boundaries to be used for solving the Laplace equation for the pressure.

Use External-Aero Favorable Settings
if you want to have the velocity potential patched with a linear value to help accelerate convergence of Scalar Equation–0 and to obtain a better guess of the velocity field for external-aero problems.

Maintain Constant Velocity Magnitude
if you want to use the flow direction obtained from solving the velocity potential (Scalar Equation–0), while maintaining a constant velocity magnitude throughout the computational domain.

Turbulence Settings
uses by default the domain averaged values for the turbulence parameters. If you want to use variable turbulence parameters you can deselect the Average Turbulent Parameters check box. When this option is disabled, then it calculates the turbulent parameters, such as kinetic energy, dissipation energy, and so on, using local flow parameters.

Species Settings
will by default initialize secondary species with zero mass or mole fractions. If you want to specify the appropriate value for the species, you must enable Specify Species Parameters.

35.17. Calculation Activities Task Page

The Calculation Activities task page allows you to set up various tasks that you can perform during the calculation, such as saving files, exporting files, creating solution animations, and command execution.
## Controls

### Autosave Every
allows you to set the frequency of the autosave.

**Edit...** opens the [Autosave Dialog Box](p. 2256).

### Automatic Export

displays a list of available export objects that will be executed during the calculations. This list and its associated buttons are only available for transient flow calculations.
Create
provides a drop-down list that contains options for creating export objects. Two options are available: the Solution Data Export option opens the Automatic Export Dialog Box (p. 2259); the Particle History Data Export option opens the Automatic Particle History Data Export Dialog Box (p. 2263).

Edit...
opens the appropriate dialog box for the selected item in the Automatic Export list.

Delete
removes the selected item from the Automatic Export list.

Execute Commands
lists available commands to be executed during the calculations.

Create/Edit...
opens the Execute Commands Dialog Box (p. 2264).

Automatically Initialize Solution and Modify Case
allows you to automatically have your solution initialized and your case file modified.

Edit...
opens the Automatic Solution Initialization and Case Modification Dialog Box (p. 2265). This button is only available when the Automatically Initialize Solution and Modify Case option is enabled.

Solution Animations
lists available solution animations.

Create/Edit...
opens the Solution Animation Dialog Box (p. 2267).

For additional information, see the following sections:
35.17.1. Autosave Dialog Box
35.17.2. Data File Quantities Dialog Box
35.17.3. Automatic Export Dialog Box
35.17.4. Automatic Particle History Data Export Dialog Box
35.17.5. Execute Commands Dialog Box
35.17.6. Define Macro Dialog Box
35.17.7. Automatic Solution Initialization and Case Modification Dialog Box
35.17.8. Solution Animation Dialog Box
35.17.9. Animation Sequence Dialog Box

35.17.1. Autosave Dialog Box

The Autosave dialog box allows you to specify automatic saving of case and data files at specified intervals during a calculation. See Automatic Saving of Case and Data Files (p. 49) for details.
Controls

Save Data File Every
specifies the frequency with which data files are saved. For steady flows you will specify the frequency in iterations, while for unsteady flows you will specify it in time steps (unless you are using the explicit time stepping formulation, in which case you will specify the frequency in iterations). The default value is set to zero, indicating that no automatic saving is performed.

When the Data File is saved, Save the Case
gives you the choice to save the case file only if it is modified or each time that the data file is saved.

If Modified During the Calculation or Manually
will result in ANSYS Fluent saving a case file whether you make a manual change, or if ANSYS Fluent makes a change to the code internally during the calculation.

Each Time
allows you to save the case file every time the data file is saved.

Retain Only the Most Recent Files
allows you to restrict the number of files saved by ANSYS Fluent if you have limited disk space. When this option is enabled, you can enter the appropriate value in the Maximum Number of Data Files field.

Only the associated case files are retained when using this option.

Important
When the Retain Only the Most Recent Files option is selected, the solution history currently in memory will be discarded and the solution history reset.

Data File Quantities
opens the Data File Quantities Dialog Box (p. 2258) where you can specify which quantities you want to automatically save to a data file for postprocessing.
Maximum Number of Data Files

specifies the maximum number of data files that can be saved at any instance. If you have constraints on the disk space, you can restrict the number of files to be saved using this field. After saving the specified number of files, ANSYS Fluent will overwrite the earliest existing file. The default value for this field is zero, which saves all the files.

File Name

specifies the root name for the files that are saved. The iteration or time-step number and an appropriate suffix (`.cas` or `.dat`) will be added to the specified root name. If the specified File Name ends in `.gz` or `.Z`, appropriate file compression will be performed. (See Reading and Writing Compressed Files (p. 43) for details about file compression.)

Append File Name with

allows you to select flow-time or time-step to be appended to the file name. This option is available only for unsteady-state calculations. The default selection is flow-time.

Decimal Places in File Name

allows you to specify the number of decimal digits in the file name. This option is available only when flow-time is selected in the Append File Name with drop-down list. The default value for this field is set to 6.

35.17.2. Data File Quantities Dialog Box

The Data File Quantities dialog box allows you to specify various quantities for postprocessing. See Setting Data File Quantities (p. 106) for details.
Controls

**Standard Quantities**
contains a listing of standard postprocessing quantities (for example, density, Mach number, temperature, and so on).

**Additional Quantities**
contains a listing of additional postprocessing quantities that are derived from the standard quantities (for example, standard pressure, velocity magnitude, and so on).

### 35.17.3. Automatic Export Dialog Box

The **Automatic Export** dialog box allows you to create an automatic export definition for solution data. See [Creating Automatic Export Definitions for Solution Data](p. 85) for details.

![Automatic Export Dialog Box](image)

**Controls**

**Name**
specifies the name of the export definition.
File Type
contains a drop-down list of file types, which control the output file format that will be written.

ABAQUS
allows you to specify the surface(s) and optional loads, based on the kind of finite element analysis selected, to be exported to an ABAQUS file (extension .inp).

ASCII
allows you to specify the surface(s), scalars, location from which the values of scalar functions are to be taken, and the delimiter separating the fields, to be exported to an ASCII file.

AVS
allows you to specify the scalars you want to write to be exported to an AVS file.

CFD-Post Compatible
allows you to specify the scalars you want to write, the cell zones from which the values of scalar functions are to be taken, the file format, and whether case files are written with every .cdat file, as part of the exporting of files that are compatible with the CFD-Post application (that is, .cdat and .cst files).

CGNS
allows you to specify the scalars you want to write and the location from which the values of scalar functions are to be taken, to be exported to a CGNS file (extension .cgns).

Data Explorer
allows you to specify the surface(s) and the scalars you want to write to be exported to a Data Explorer file (extension .dx).

EnSight Case Gold
allows you to specify the scalars you want to write, the cell zones, interior zone surfaces, and location in the cell from which the values of scalar functions are to be taken, and the file format, to be exported to an EnSight file (extension .geo, .vel, .scl1, or .encas).

FAST
allows you to specify the scalars you want to write, to be exported as a grid file (Plot3D format), a velocity file, and a scalar file. This option is available only for a triangular or tetrahedral mesh.

FAST Solution
allows you to export a single file containing density, velocity, and total energy data. This option is available only for a triangular or tetrahedral mesh.

Fieldview Unstructured
allows you to specify the scalars you want to write and the cell zones from which the values of scalar functions are to be taken, to be exported to a FIELDVIEW binary file (extension .fvuns) and a regions file (extension .fvuns.fvreg).

I-deas Universal
allows you to specify the surface(s), scalars, and optional loads, based on the kind of finite element analysis selected, to be exported to an I-deas Universal file.

Mechanical APDL Input
allows you to specify the surface(s) and optional loads, based on the kind of finite element analysis selected, to be exported to a Mechanical APDL Input file (extension .cdb).
NASTRAN
allows you to specify the surface(s), scalars, and optional loads, based on the kind of finite element analysis selected, to be exported to a NASTRAN file (extension .bdf).

PATRAN
allows you to specify the surface(s), scalars, and optional loads, based on the kind of finite element analysis selected, to be exported to a PATRAN neutral file (extension .out).

RadTherm
allows you to specify the surface(s) for which you want to write data and the method of writing the heat transfer coefficient, to be exported to a PATRAN neutral file (extension .neu). This option is available only when the Energy Equation is enabled.

Tecplot
allows you to specify the surface(s) and the scalars you want to write, to be exported to a Tecplot file.

Cell Zones
specifies the cell zones for which data is to be written for a CFD-Post compatible, EnSight, or FIELDVIEW file.

Surfaces
specifies the surfaces for which data is to be written for an ABAQUS, ASCII, Data Explorer, I-deas Universal, Mechanical APDL Input, NASTRAN, PATRAN, RadTherm, or Tecplot file.

Quantities
specifies valid quantities for output. The attributes of the list are modified based on the active file type. The list may be a single-selection or a multiple-selection list or it may be disabled, depending on the selected File Type.

Analysis (for ABAQUS, I-deas Universal, Mechanical APDL Input, NASTRAN, and PATRAN formats)
specifies the finite element analysis intended.

Structural
specifies structural analysis and allows you to select the Structural Loads to be written.

Thermal
specifies thermal analysis and allows you to select the Thermal Loads to be written.

Structural Loads
contains optional structural loads that can be written to ABAQUS, I-deas Universal, Mechanical APDL Input, NASTRAN, and PATRAN files. This option is available only when Structural analysis is selected.

Force
enables force to be written as a load for a structural analysis.

Pressure
enables pressure to be written as a load for a structural analysis.

Temperature
enables temperature to be written as a load for a structural analysis. This option is available only when the Energy Equation is enabled.

Thermal Loads
contains optional thermal loads that can be written to ABAQUS, I-deas Universal, Mechanical APDL Input, NASTRAN, and PATRAN files. This option is available only when Thermal analysis is selected.
**Temperature**
   enables temperature to be written as a load for a thermal analysis.

**Heat Flux**
   enables heat flux to be written as a load for a thermal analysis.

**Heat Trans Coeff**
   enables heat transfer coefficient to be written as a load for a thermal analysis.

**Location** (for ASCII, CGNS, and EnSight Case Gold formats)
   specifies the location from which the values of scalar functions are to be taken.

**Node**
   specifies that data values at the node points are to be exported.

**Cell Center**
   specifies that data values from the cell centers are to be exported.

**Format** (for CFD-Post Compatible and EnSight Case Gold)
   specifies the file format.

**Binary**
   specifies the file format as binary.

**ASCII**
   specifies the file format as ASCII.

**Heat Transfer Coefficient** (for RadTherm format only)
   specifies the basis for the heat transfer coefficient exported.

**Flux Based**
   specifies the flux based method for writing the heat transfer coefficient.

**Wall Function**
   specifies the wall function based method for writing the heat transfer coefficient.

**Write Case File Every Time** (for CFD-Post Compatible)
   specifies whether a case file is written with every .cdat file, or if case files are written based on the settings specified by the file/transient-export/settings/cfd-post-compatible text command.

**Frequency (Time Steps)**
   specifies the frequency for appending the data during the solution process.

**File Name**
   specifies the root name for the files to be saved.

**Append File Name with**
   allows you to select **flow-time** or **time-step** to be appended to the file name.

**Decimal Places in File Name**
   allows you to specify the number of decimal digits in the file name. This option is available only when **flow-time** is selected in the **Append File Name with** drop-down list. The default value for this field is set to **6**.
35.17.4. Automatic Particle History Data Export Dialog Box

The **Automatic Particle History Data Export** dialog box allows you to create an automatic particle history export definition for solution data. See *Creating Automatic Export Definitions for Transient Particle History Data (p. 88)* for details.

### Controls

**Name**
- specifies the name of the particle history export definition.

**File Type**
- specifies the type of the file you want to write.
  - **CFD-Post** allows you to write the file in CFD-Post particle tracks format, which can be read in **CFD-Post**.
  - **FieldView** allows you to write the file in **FIELDVIEW** format, which can be read in **FIELDVIEW**.
  - **EnSight** allows you to write the file in **EnSight** format.

**Injections**
- allows you to select the required injection from the list of predefined injections.

**Quantity**
- contains the list of variables for which you can export the particle data.

**Skip**
- allows you to “thin” or “sample” the number of particles that are exported.
Frequency (Time Steps) or (DPM Iterations)  
specifies the frequency of particle time steps that are used for saving the export file.

Separate Files for Each Time Step  
allows you to have separate exported data files for each time step. Available only when EnSight is selected as the File Type.

Particle File Name  
allows you to specify the file name/directory for the exported data, using the Browse... button.

Ensight Encas File Name  
is the file name you will specify if you selected EnSight under File Type. Use the Browse... button to select the .encas file that was created when you exported the file with the File/Export... menu option.

35.17.5. Execute Commands Dialog Box

The Execute Commands dialog box allows you to define commands to be executed during the calculation. See Executing Commands During the Calculation (p. 1501) for details about using this feature.

Controls

Defined Commands  
sets the total number of monitor commands to be defined.

Active  
activates/deactivates the execution of each command.

Name  
specifies a name for each command.

Every, When  
indicate how often the command is to be executed. You can enter the interval under Every and select Iteration or Time Step under When. (Time Step is a valid choice only if you are calculating unsteady flow.)

Command  
specifies the command to be executed. You can enter text commands or the name of a command macro that you have defined in the Define Macro Dialog Box (p. 2265).
**Define Macro...**

opens the Define Macro Dialog Box (p. 2265), in which you can define command macros.

**End Macro**

ends the definition of a macro. (This button will replace the Define Macro... button when you click OK in the Define Macro dialog box.)

### 35.17.6. Define Macro Dialog Box

The Define Macro dialog box allows you to define macros for automatic execution by the command monitor, or for interactive use by you. See Defining Macros (p. 1503) for details.

![Define Macro Dialog Box](image)

**Controls**

**Macros**
contains a selectable list of the currently-defined macros.

**Name**
specifies a name for the command macro.

### 35.17.7. Automatic Solution Initialization and Case Modification Dialog Box

The Automatic Solution Initialization and Case Modification dialog box allows you to specify the solution initialization method and to modify the case. See Automatic Initialization of the Solution and Case Modification (p. 1505) for details.
Controls

Initialization Method

The tab contains several choices for initializing the solution.

Initialize with Values from the Case
uses the values set in the Solution Initialization task page.

Use Solution Data From File
requires you to read in a data file containing the desired initialization for the case.

Use Solution Data From Previous Parametric Run with Workbench
(transient cases only) requires you to select one of two methods to initialize the first run. You can Initialize with Values from the Case, which uses the values set in the Solution Initialization task page. Otherwise, you can Use Solution Data from File, which requires you to read in a data file containing the desired initialization for the case.

Use Existing Solution Data
is analogous to changing the values in a case and continuing the calculation. However, the iteration counter will be reset to 0 so that the modifications can be applied. Use this method when no solution data exists, similar to the first run.

Case Modification

allows you to indicate how long you would like to run with the original settings, then make any modifications to the case settings.

Defined Modifications

indicates the number of modifications for the case file.

Active
allows you to enable or disable a defined case modification.

Name
represents the name of the case modification.

Commands
represents an area where you can input text commands.

Number of Iterations/Time Steps
represents the number of iterations or time steps that you want to run defined case modification commands.
Define Macro...
opens the Define Macro Dialog Box (p. 2265), in which you can define command macros.

35.17.8. Solution Animation Dialog Box

You can use the Solution Animation dialog box to create an animation sequence and indicate how often each frame of the sequence should be created. See Defining an Animation Sequence (p. 1511) for details about the items below.

![Solution Animation Dialog Box]

Controls

Animation Sequences
sets the total number of animation sequences to be defined.

Active
activates/deactivates each animation sequence.

Name
specifies a name for each animation sequence.

Every, When
indicate how often you want to create a new frame in the animation sequence. You can enter the interval under Every and select Iteration or Time Step in the drop-down list below When. (Time Step is a valid choice only if you are calculating unsteady flow.)

Define...
opens the Animation Sequence Dialog Box (p. 2267), in which you can define an animation sequence.

35.17.9. Animation Sequence Dialog Box

The Animation Sequence dialog box allows you to define each animation sequence. See Defining an Animation Sequence (p. 1511) for details about the items below.
Controls

**Sequence Parameters**
contains general parameters for the storage and display location of the animation sequence.

**Storage Type**
specifies whether you want ANSYS Fluent to save the animation sequence frames in memory (*In Memory*) or on your computer's hard drive (*Metafile* or *PPM Image*).

**Name**
specifies the name of the sequence.

**Window**
specifies the ID of the graphics window where you want the plot to be displayed. You must click **Set** to set the specified **Window**.

When ANSYS Fluent is iterating, the active graphics window is set to this window to update the plot. If you want to maintain each animation in a separate window, specify a different **Window** ID for each.

**Set**
sets the specified **Window** to be the window where the plot will be displayed. (The specified window will open, if it is not already open.)

**Storage Directory**
specifies the directory where you want to store the files. (This can be a relative or absolute path.)

**Display Type**
specifies the type of display to be animated.

**Mesh**
opens the **Mesh Display Dialog Box** (p. 1891) where you can select a mesh display.

**Contours**
opens the **Contours Dialog Box** (p. 2283) where you can select a contour display.
Pathlines
opens the Pathlines Dialog Box (p. 2291) where you can select pathlines to display.

Particle Tracks
opens the Particle Tracks Dialog Box (p. 2297) where you can select particle tracks to display.

Vectors
opens the Vectors Dialog Box (p. 2286) where you can select a vector display.

XY Plot
opens the Solution XY Plot Dialog Box (p. 2335) where you can select a solution XY plot.

Monitor
selects a monitor plot.

Monitor Type
contains a drop-down list of the available monitor plots (Residuals, Statistics, and the names of any monitors you have created).

Create
provides a drop-down list that contains options for creating surface, volume, drag, lift, and moment monitors.

Edit...
opens the dialog box that corresponds to the selected display or monitor type (for example, the Contours dialog box if you have selected Contours).

35.18. Run Calculation Task Page

The Run Calculation task page allows you to start the solver iterations. See Performing Steady-State Calculations (p. 1454) and Performing Time-Dependent Calculations (p. 1462) for details about the items below.
Controls

Check Case... opens the Case Check Dialog Box (p. 2274).

Preview Mesh Motion... opens the Mesh Motion Dialog Box (p. 2200).

Pseudo Transient Options

is available for fluid and solid zones and will only appear for steady-state cases, where the pressure-based coupled solver is used. Note that the Pseudo Transient option must be enabled in the Solution Methods Task Page (p. 2204). For details about the available options, see Performing Pseudo Transient Calculations (p. 1455).

Number of Iterations

(for steady flow calculations) sets the number of iterations to be performed. (For unsteady calculations using the explicit unsteady formulation, this will specify the number of time steps, since each iteration will be a time step.)

Time Stepping Method

(for transient flow calculations) contains options for how the time step is determined.

Fixed

selects a fixed time step, equal to the specified Time Step Size.
Adaptive
selects a time step that is initially equal to the specified Time Step Size, but gets modified by ANSYS Fluent as the calculation proceeds. See Adaptive Time Stepping (p. 1472) for details.

Variable
enables variable time stepping method. The inputs are same as for the adaptive time stepping method, with the exception of specifying a global Courant number. Variable is selectable when the VOF multiphase model is enabled. See Variable Time Stepping (p. 1475) for details.

Settings...
opens either the Adaptive Time Step Settings Dialog Box (p. 2275) when Adaptive is selected as the Time Stepping Method, or the Variable Time Step Settings Dialog Box (p. 2277) when Variable is selected as the Time Stepping Method.

Time Step Size(s)
(for transient flow calculations) sets the magnitude of the (physical) time step $\Delta t$.

Time Step Size for Acoustic Data Export
determines the highest frequency that the acoustic analysis reproduces. This is available when the FW-H acoustics model is enabled.

Number of Time Steps
(for transient flow calculations) sets the number of time steps to be performed.

Options
contains options related to unsteady calculations.

Extrapolate Variables
instructs ANSYS Fluent to predict the solution variable values for the next time step and then input that predicted value as an initial guess for the inner iterations of the current time step.

Data Sampling for Time Statistics
enables the sampling of data during an unsteady calculation. See User Inputs for Time-Dependent Problems (p. 1463) and Postprocessing for Time-Dependent Problems (p. 1476) for details.

Sampling Interval
allows you to specify the frequency of the Data Sampling for Time Statistics.

Sampling Options...
opens the Sampling Options Dialog Box (p. 2278) for the Data Sampling for Time Statistics.

Time sampled
displays the time period over which data has been sampled for the postprocessing of the mean and RMS values.

Max Iterations/Time Step
for unsteady flow calculations using an implicit unsteady formulation) sets the maximum number of iterations to be performed per time step. If the convergence criteria are met before this number of iterations is performed, the solution will advance to the next time step. See User Inputs for Time-Dependent Problems (p. 1463) for details.

Reporting Interval
sets the number of iterations that will pass before convergence monitors will be printed and plotted. The default is 1 (that is, reports will be updated after each iteration).
**Postprocess Pollutants**
results in the automatic postprocessing of pollutants during a transient simulation. This option is available when one of the pollution models is enabled.

**Max Post Iterations/Time Step**
sets the maximum number of postprocessing iterations to be performed per time step. This field is available when the Postprocess Pollutants option is enabled.

**Profile Update Interval**
sets the number of iterations that will pass before user-defined functions for boundary profiles will be updated.

**Solution Steering**
allows you to set parameters that will help ANSYS Fluent guide the calculations to a converged solution (available only for steady-state flows in the density-based implicit solver). See Solution Steering (p. 1537) for more information. When enabled, the following options are available:

- **Flow Type**
  allows you to select the flow type that best describes the flow in the solution domain. Five choices are available: incompressible, subsonic, transonic, supersonic, and hypersonic.

- **Use FMG Initialization**
  allows for full multigrid initialization.

- **First to Higher Order Blending**
  allows you to reduce the desired solution accuracy by selecting a blending factor less than 100%. The default setting is 100%. See First-to-Higher Order Blending in the Theory Guide for more information. The blending factor will be grayed out if Second Order Upwind discretization for the Flow equations is not selected in the Solution Methods task page. The solution accuracy may be reduced (typical values are 75% or 50%) if it is not possible to obtain a converged solution with the maximum second-order accuracy (blending = 100%).

- **More Settings...**
  opens the Solution Steering Dialog Box (p. 2273).

- **Courant Number**
  is a non-adjustable field displaying the current CFL number, which allows you to view it during the calculation.

- **Data File Quantities...**
  opens the Data File Quantities Dialog Box (p. 2258).

- **Acoustic Signals...**
  opens the Acoustic Signals Dialog Box (p. 2279). This button is only available when the acoustics model is enabled.

**Calculate**
starts the calculations. While the calculation is in progress, a Working dialog box will appear. Clicking the Cancel button or typing Ctrl+c in the console window will interrupt the calculation at the earliest safe stopping point after the current iteration (in steady-state simulations) or the current time step (in transient simulations). The stopping point is chosen so that the field variables and solver state are updated and internally consistent. If you are running a transient simulation and...
want to stop the simulation immediately (before the completion of the current time step), you can type **Ctrl+c** a second time.

For additional information, see the following sections:
- **35.18.1. Solution Steering Dialog Box**
- **35.18.2. Case Check Dialog Box**
- **35.18.3. Adaptive Time Step Settings Dialog Box**
- **35.18.4. Variable Time Step Settings Dialog Box**
- **35.18.5. Sampling Options Dialog Box**
- **35.18.6. Acoustic Signals Dialog Box**

### 35.18.1. Solution Steering Dialog Box

The **Solution Steering** dialog box is used to set the parameters that control the solution steering strategy. Solution steering will typically perform full multigrid (FMG) initialization followed by two iterative stages (Stage 1 and Stage 2). The purpose of Stage 1 is to navigate the solution from the difficult initial phase of the solution toward convergence by insuring maximum stability. During this stage, the solution is advanced gradually from 1st-order accuracy to maximum accuracy (user specified and typically 2nd-order) at a constant low CFL value. In Stage 2, the solution is driven hard towards convergence by regular adjustments of the CFL value to insure fast convergence as well as to prevent possible divergence. In Stage 2, the residual history is monitored and analyzed through regular intervals to determine if an increase or decrease in CFL value is needed to obtain fast convergence or to prevent divergence. See **Solution Steering (p. 1537)** for details.

![Solution Steering Dialog Box](image_url)

#### Controls

**Steering Settings**

allows you to modify the steering parameters used in Stages 1 and 2.
Stage 1
allows you to set parameters relating to stage 1.

Duration
is the number of iterations in stage 1. The CFL number used during these iterations is set in the Initial field, in the Courant Number group box.

Stage 2
allows you to set parameters relating to stage 2.

Update the Courant Number
allows you to update the Courant number either Immediately, or After a specified number of iterations.

Courant Number Update Interval
defines the frequency at which the Courant number is updated.

Courant Number
allows you to set the starting (Initial) and maximum allowed (Maximum) Courant number values. The solution steering algorithm will not allow the solver to exceed the maximum Courant number, but will allow the solver to use a Courant number less than the initial Courant number if divergence in the solution has occurred.

Explicit Under-Relaxation Factor
allows the solution to be under-relaxed to improve convergence.

Default
resets any changes made to the parameters to their original default values.

FMG Settings
allows you to set FMG parameters. For more information about FMG initialization, refer to Full Multigrid (FMG) Initialization (p. 1449).

Number of Multigrid Levels
allows you to set the number of multigrid levels.

Number of Cycles
allows you to set the number of cycles for a selected level.

FMG Courant Number
allows you to set the FMG Courant number.

Default
resets any changes to the original default values.

35.18.2. Case Check Dialog Box
This function provides you with guidance and best practices when choosing case parameters and models. Your case will be checked for compliance in the mesh, models, boundary and cell zone conditions, material properties, and solver categories. Established rules are available for each category, with recommended changes to your current settings. Information about each of the recommendations is available in Checking Your Case Setup (p. 1518).
Controls

Mesh
displays recommendations, if any, relating the to the mesh used in the case. See Checking the Mesh (p. 1521) for details.

Models
displays recommendations, if any, relating the to the models used in the case. See Checking Model Selections (p. 1523) for details.

Boundaries and Cell Zones
displays recommendations, if any, relating the to the cell zones or boundaries defined in the case. See Checking Boundary and Cell Zone Conditions (p. 1525) for details.

Materials
displays recommendations, if any, relating the to the materials defined in the case. See Checking Material Properties (p. 1528) for details.

Solver
displays recommendations, if any, relating the to the solver settings used in the case. See Checking the Solver Settings (p. 1529) for details.

35.18.3. Adaptive Time Step Settings Dialog Box

The Adaptive Time Step Settings dialog box is used to set the parameters that control the adaptive time stepping. See Adaptive Time Stepping (p. 1472) for details.
Controls

**Truncation Error Tolerance**

specifies the threshold value to which the computed truncation error is compared. Increasing this value will lead to an increase in the size of the time step and a reduction in the accuracy of the solution. Decreasing it will lead to a reduction in the size of the time step and an increase in the solution accuracy, although the calculation will require more computational time. For most cases, the default value of 0.01 is acceptable.

**Ending Time**

specifies an ending time for the calculation. Since the ending time cannot be determined by multiplying the number of time steps by a fixed time step size, you need to specify it explicitly.

**Minimum/Maximum Time Step Size**

specify the upper and lower limits for the size of the time step. If the time step becomes very small, the computational expense may be too high; if the time step becomes very large, the solution accuracy may not be acceptable to you. You can set the limits that are appropriate for your simulation.

**Minimum/Maximum Step Change Factor**

limit the degree to which the time step size can change at each time step. Limiting the change results in a smoother calculation of the time step size, especially when high-frequency noise is present in the solution. If the time step change factor, $f$, is computed as the ratio between the specified truncation error tolerance and the computed truncation error, the size of time step $\Delta t_n$ is computed as follows:

- If $1 < f < f_{max}$, $\Delta t_n$ is increased to meet the required tolerance.
- If $f < f_{min}$, $\Delta t_n$ is decreased.
- If $f_{min} < f < 1$, $\Delta t_n$ is unchanged.
- If $f < 1$, $\Delta t_n$ is increased, but its maximum possible value is $f_{max} \Delta t_n - 1$. 

Release 15.0 - © SAS IP Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.
**Number of Fixed Time Steps**

specifies the number of fixed-size time steps that should be performed before the size of the time step starts to change. The size of the fixed time step is the value specified for **Time Step Size** under **Time**.

**User-Defined Time Step**

contains a drop-down list of available user-defined functions.

### 35.18.4. Variable Time Step Settings Dialog Box

The **Variable Time Step Settings** dialog box contains parameters related to variable time stepping. See **Variable Time Stepping (p. 1475)** for details.

![Variable Time Step Settings Dialog Box](image)

**Controls**

**Global Courant Number**

allows you to specify the Courant number. The default value for the **Global Courant number** is 2.

**Ending Time**

specifies an ending time for the calculation. Since the ending time cannot be determined by multiplying the number of time steps by a fixed time step size, you need to specify it explicitly.

**Minimum/Maximum Time Step Size**

specify the upper and lower limits for the size of the time step. If the time step becomes very small, the computational expense may be too high; if the time step becomes very large, the solution accuracy may not be acceptable to you. You can set the limits that are appropriate for your simulation.

**Minimum/Maximum Step Change Factor**

limit the degree to which the time step size can change at each time step. Limiting the change results in a smoother calculation of the time step size, especially when high-frequency noise is present in the solution. If the time step change factor, $f$, is computed as the ratio between the specified truncation error tolerance and the computed truncation error, the size of time step $\Delta t_n$ is computed as follows:

- If $1 < f < f_{\text{max}}$, $\Delta t_n$ is increased to meet the required tolerance.
• If $1 < f_{\text{max}} < f$, $\Delta t_n$ is increased, but its maximum possible value is $f_{\text{max}} \Delta t_{n-1}$.

• If $f_{\text{min}} < f < 1$, $\Delta t_n$ is unchanged.

• If $f < f_{\text{min}} < 1$, $\Delta t_n$ is decreased.

**Number of Fixed Time Steps**

specifies the number of fixed-size time steps that should be performed before the size of the time step starts to change. The size of the fixed time step is the value specified for **Time Step Size** under **Time**.

**User-Defined Time Step**

contains a drop-down list of available user-defined functions.

### 35.18.5. Sampling Options Dialog Box

The **Sampling Options** dialog box allows you to specify a collection of statistics for: **Flow Shear Stresses**, **Flow Heat Fluxes**, **Wall Statistics**, **DPM Variables**, and **Custom Field Functions**.

![Sampling Options Dialog Box](image)

**Controls**

**Collect Statistics for...**

contains options for the variables you want to be able to postprocess.

- **Flow Shear Stresses**
  
  allows you to enable or disable the flow shear stress statistics for postprocessing.

- **Flow Heat Fluxes**
  
  allows you to enable or disable the flow heat fluxes statistics for postprocessing.

- **Wall Statistics**
  
  allows you to enable or disable the wall statistics for postprocessing.
DPM Variables
allows you to enable or disable DPM variable statistics for postprocessing.

Custom Field Functions
allows you to select the previously defined custom field functions you want to be able to postprocess.

35.18.6. Acoustic Signals Dialog Box

The **Acoustic Signals** dialog box is used to compute and save the sound pressure signals. See Postprocessing the FW-H Acoustics Model Data (p. 1125) for details about the items below.

![Acoustic Signals Dialog Box](image)

**Controls**

**Options**
contains the options available for acoustic signal postprocessing.

- **Write Acoustic Signals**
  enables the parameters needed to write the sound pressure data to files.

- **Read Unsteady Acoustic Source Data Files**
  enables the parameters needed to compute the sound pressure signals using the source data saved to files.

**Active Source Zones**
contains source zones you want to include to compute sound. See Specifying Source Surfaces (p. 1120) for details.

**Receivers**
contains all the receivers for which you can compute sound.
**Source Data Files**
contains all the source data files that you can use to compute sound.

**Load Index File...**
opens the Select File dialog box, in which you can select the index file for your computation.

**Write**
writes the sound pressure data. This button will appear only when Write Acoustic Signals is selected under Options.

**Compute/Write**
computes and saves the sound pressure data. This button will appear only when Read Unsteady Acoustic Source Data Files is selected under Options.

**Receivers...**
opens the Acoustic Receivers Dialog Box (p. 2013) in which you can define additional receivers.

### 35.19. Results Task Page

The Results task page introduces you to the main tasks involved in setting up and displaying the results of your CFD simulation using ANSYS Fluent.

**Results**
The task pages under Results provide quick access to the panels used for the most common postprocessing tasks. Additional postprocessing panels can be accessed through the main menu bar above.

Note that access to surface creation is provided within the postprocessing panels, as well as through the Surface menu above.

**35.20. Graphics and Animations Task Page**

The Graphics and Animation task page allows you to visualize the results of your CFD simulation by allowing you to set up plots of contours, vectors, pathlines, particle tracks, scene descriptions and animations. See Displaying Graphics (p. 1605) for more information.
Controls

Graphics
displays a list of the available graphics objects.

You can double-click an item in the Graphics list to open the corresponding dialog box, or you can select the item in the list and click the Set Up... button.

Mesh
- selecting this item and clicking the Set Up... button opens the Mesh Display Dialog Box (p. 1891).

Contours
- selecting this item and clicking the Set Up... button opens the Contours Dialog Box (p. 2283).

Vectors
- selecting this item and clicking the Set Up... button opens the Vectors Dialog Box (p. 2286).

Pathlines
- selecting this item and clicking the Set Up... button opens the Pathlines Dialog Box (p. 2291).

Particle Tracks
- selecting this item and clicking the Set Up... button opens the Particle Tracks Dialog Box (p. 2297).

Set Up...
opens the dialog box corresponding to the selected object in the Graphics list.
Animations displays a list of the available animation objects.

You can double-click an item in the Animations list to open the corresponding dialog box, or you can select the item in the list and click the Set Up... button.

Sweep Surface
- selecting this item and clicking the Set Up... button opens the Sweep Surface Dialog Box (p. 2306).

Scene Animation
- selecting this item and clicking the Set Up... button opens the Animate Dialog Box (p. 2308).

Solution Animation
- selecting this item and clicking the Set Up... button opens the Playback Dialog Box (p. 2312).

Set Up...
opens the dialog box corresponding to the selected object in the Animations list.

Options...
opens the Display Options Dialog Box (p. 2314).

Scene...
opens the Scene Description Dialog Box (p. 2317).

Views...
opens the Views Dialog Box (p. 2323).

Lights...
opens the Lights Dialog Box (p. 2328).

Colormap...
opens the Colormap Dialog Box (p. 2329).

Annotate...
opens the Annotate Dialog Box (p. 2332).

35.20.1. Contours Dialog Box

The **Contours** dialog box controls the display of contour and profile plots. See [Displaying Contours and Profiles](p. 1612) for details about the items below.

![Contours Dialog Box](image)

**Controls**

**Options**

contains the check buttons that set various contour display options.
Filled
toggles between filled contours and line contours.

Node Values
toggles between using scalar field values at nodes and at cell centers for computing the contours. When the Filltoggles option is off, Node Values is always on. See Choosing Node or Cell Values (p. 1618) for details.

Global Range
toggles between basing the minimum and maximum values on the range of values on the selected surfaces (off), and basing them on the range of values in the entire domain (on, the default).

Auto Range
toggles between automatic and manual setting of the contour range. Any time you change the Contours of selection, Auto Range is reset to on.

Clip to Range
determines whether or not values outside the prescribed Min/Max range are contoured when using Filled contours. If selected, values outside the range will not be contoured. If not selected, values below the Min value will be colored with the lowest color on the color scale, and values above the Max value will be colored with the highest color on the color scale. See Specifying the Range of Magnitudes Displayed (p. 1616) for details.

Draw Profiles
causes the addition of a profile plot to the contour plot. The Profile Options Dialog Box (p. 2285) is opened when Draw Profiles is selected.

Draw Mesh
toggles between displaying and not displaying the mesh. The Mesh Display Dialog Box (p. 1891) is opened when Draw Mesh is selected.

Levels
sets the number of contour levels that are displayed.

Setup
indicates the ID number of the contour setup. For frequently used combinations of contour fields and options, you can store the information needed to generate the contour plot by specifying a Setup number and setting up the desired information in the Contours dialog box. See Storing Contour Plot Settings (p. 1619) for details.

Surface Name Pattern
specifies the pattern to look for in the names of surfaces. Type the pattern in the text field and click Match to select (or deselect) the zones in the Surfaces list with names that match the specified pattern. See Generating Contour and Profile Plots (p. 1613) for information about matching additional characters using * and ?.

Contours of
contains a list from which you can select the scalar field to be contoured.

Min
shows the minimum value of the scalar field. If Auto Range is off, you can set the minimum by typing a new value.
Max
shows the maximum value of the scalar field. If **Auto Range** is off, you can set the maximum by typing a new value.

Surfaces
contains a list from which you can select the surfaces on which to draw contours. For 2D cases, if no surface is selected, contouring is done on the entire domain. For 3D cases, you must always select at least one surface.

New Surface
is a drop-down list button that contains a list of surface options:

- **Point**
  opens the Point Surface Dialog Box (p. 2239).
- **Line/Rake**
  opens the Line/Rake Surface Dialog Box (p. 2240).
- **Plane**
  opens the Plane Surface Dialog Box (p. 2241).
- **Quadric**
  opens the Quadric Surface Dialog Box (p. 2243).
- **Iso-Surface**
  opens the Iso-Surface Dialog Box (p. 2245).
- **Iso-Clip**
  opens the Iso-Clip Dialog Box (p. 2246).

Surface Types
contains a selectable list of types of surfaces. If you select (or deselect) an item in this list, all surfaces of that type will be selected (or deselected) automatically in the **Surfaces** list.

Display
draws the contours in the active graphics window.

Compute
calculates the scalar field and updates the **Min** and **Max** values (even when **Auto Range** is off).

### 35.20.2. Profile Options Dialog Box

The **Profile Options** dialog box controls the scaling and projection direction of profiles. It is opened from the **Contours Dialog Box** (p. 2283), and you will display the profiles using the Display button in that dialog box. See Displaying Contours and Profiles (p. 1612) for details about the items below.
Controls

**Reference Value**
sets the “zero height” reference value for the profile. Any point on the profile with a value equal to the Reference Value will be plotted exactly on the defining surface. Values greater than the Reference Value will be projected ahead of the surface (in the direction of Projection Dir. and scaled by Scale Factor), and values less than the Reference Value will be projected behind the surface.

**Scale Factor**
sets the length scale factor for projection. After subtracting off the Reference Value, ANSYS Fluent multiplies the resulting solution value by the Scale Factor to form a length.

**Projection Dir.**
sets the direction in which profiles are projected. In 2D, for example, a contour plot of pressure on the entire domain can be projected in the z direction to form a carpet plot, or a contour plot of x velocity on a sequence of x-coordinate slice lines can be projected in the x direction to form a series of velocity profiles.

### 35.20.3. Vectors Dialog Box

The Vectors dialog box controls the display of vector plots. See Displaying Vectors (p. 1619) for details about the items below.
**Controls**

**Options**

contains check buttons that set various display options.

**Global Range**

toggles between basing the minimum and maximum values on the range of values on the selected surfaces (off), and basing them on the range of values in the entire domain (on, the default).

**Auto Range**

toggles between automatic and manual setting of the range of scalar field values.

**Clip to Range**

toggles the display of vectors that have a value outside the range specified by Min and Max. When on, no vectors are displayed outside the range. When off, vectors are displayed outside the range using the colors at the top and bottom of the color scale. This option is applicable only when **Auto Range** is off. See Specifying the Range of Magnitudes Displayed (p. 1623) for details.

**Auto Scale**

enables the scaling of all vectors in the domain such that when the **Scale** is 1, there will be minimal overlap of vectors.

**Draw Mesh**

toggles between displaying and not displaying the mesh. The **Mesh Display Dialog Box (p. 1891)** is opened when **Draw Mesh** is selected.
Style
selects the style in which the vectors are drawn. Available styles are cone, filled-arrow, arrow, harpoon, and headless.

Scale
sets the factor by which the vectors should be scaled. See Scaling the Vectors (p. 1621) for details.

Skip
allows you to “thin” or “sample” the vectors that are displayed. See Skipping Vectors (p. 1622) for details.

Vector Options...
opens the Vector Options Dialog Box (p. 2289), in which you can set additional options for vector displays.

Custom Vectors...
opens the Custom Vectors Dialog Box (p. 2290), in which you can define your own vector fields.

Surface Name Pattern
specifies the pattern to look for in the names of surfaces. Type the pattern in the text field and click Match to select (or deselect) the zones in the Surfaces list with names that match the specified pattern. See Generating Vector Plots (p. 1620) for information about matching additional characters using * and ?.

Vectors of
contains a list from which you can select the vector field to be plotted.

Color by
contains a list from which you can select the scalar field by which the vectors are colored.

Min
shows the value to which the lower end of the color scale is mapped. You can set this value manually if Auto Range is off.

Max
shows the value to which the upper end of the color scale is mapped. You can set this value manually if Auto Range is off.

Surfaces
contains a list from which you can select the surfaces on which to display vectors. In 2D, vectors are displayed on the entire domain if no surface is selected.

New Surface
is a drop-down list button that contains a list of surface options:

Point
opens the Point Surface Dialog Box (p. 2239).

Line/Rake
opens the Line/Rake Surface Dialog Box (p. 2240).

Plane
opens the Plane Surface Dialog Box (p. 2241).

Quadric
opens the Quadric Surface Dialog Box (p. 2243).
Iso-Surface
opens the Iso-Surface Dialog Box (p. 2245).

Iso-Clip
opens the Iso-Clip Dialog Box (p. 2246).

Surface Types
contains a selectable list of types of surfaces. If you select (or deselect) an item in this list, all surfaces of that type will be selected (or deselected) automatically in the Surfaces list.

Display
draws the vectors in the active graphics window.

Compute
calculates the scalar field and updates the Min and Max values (even when Auto Range is off).

35.20.4. Vector Options Dialog Box

The Vector Options dialog box allows you to set additional parameters for vector displays. It is opened from the Vectors Dialog Box (p. 2286). See Vector Plot Options (p. 1621) for details about the items below.

Controls

In Plane
toggles the display of vector components in the plane of the surface selected for display. This feature is useful for visualizing components that are normal to the flow. See Drawing Vectors in the Plane of the Surface (p. 1622) for details.

Fixed Length
enables the display of vectors that are all the same length. See Displaying Fixed-Length Vectors (p. 1623) for details.

X, Y, Z Component
toggle the display of the Cartesian components of the vectors. See Displaying Vector Components (p. 1623) for details.

Scale Head
controls the size of the arrowhead on vector styles that include heads.

Color
specifies a single color for the display of all vectors. See Displaying Vectors Using a Single Color (p. 1624) for details.
35.20.5. Custom Vectors Dialog Box

The **Custom Vectors** dialog box allows you to define custom vectors based on existing quantities. Any vectors that you define will be added to the **Vectors of** list in the **Vectors Dialog Box** (p. 2286). To open the **Custom Vectors** dialog box, click **Custom Vectors...** in the **Vectors** dialog box. See Creating and Managing Custom Vectors (p. 1624) for details about custom vectors.

![Custom Vectors Dialog Box](image)

**Controls**

- **Vector Name**
  - specifies the name of the vector you are defining. Should you decide to change the name after you have defined the vector, you can do so in the **Vector Definitions Dialog Box** (p. 2290), which you can open by clicking on the **Manage...** button.

- **X, Y, Z Component**
  - specify the x, y, and z components of the vector. Each drop-down list contains the available field functions.

- **Define**
  - creates the vector and adds it to the **Vectors of** list in the **Vectors Dialog Box** (p. 2286).

- **Manage...**
  - opens the **Vector Definitions Dialog Box** (p. 2290), which enables you to check, rename, save, load, and delete custom vectors.

35.20.6. Vector Definitions Dialog Box

The **Vector Definitions** dialog box allows you to check, rename, save, load, and delete custom vectors that you defined in the **Custom Vectors Dialog Box** (p. 2290). See Creating and Managing Custom Vectors (p. 1624) for details about the items below.
Controls

**X, Y, Z Component**
- display the $x$, $y$, and $z$ components of the vector.

**Vectors**
- contains a selectable list of custom vectors. When you select a vector, its components will appear in the **X, Y, and Z Component** fields, and its name will appear in the **Name** field.

**Name**
- displays the name of the currently selected vector. You can enter a new name in this box if you want to rename the vector.

**Rename**
- changes the name of the selected function to the name specified in the **Name** field.

**Delete**
- deletes the selected vector.

**Save...**
- opens the Select File dialog box, in which you can specify a file in which to save all of the custom vectors in the **Vectors** list.

**Load...**
- opens the Select File dialog box, in which you can specify a file from which to read custom vectors (a file that you saved using the **Save...** button above).

### 35.20.7. Pathlines Dialog Box

The **Pathlines** dialog box controls the generation and display of pathlines. See Displaying Pathlines (p. 1626) for details about the items below.
Controls

Options contains the options described below:

Oil Flow
toggles between regular pathlines and oil-flow pathlines. When this option is selected, pathlines are
constrained to lie on the zone selected in the On Zone list.

Reverse
specifies that each particle's path is traced back in time. This option is turned off by default.

Node Values
specifies that node values should be interpolated to compute the scalar field at a particle location.
This option is turned on by default. See Choosing Node or Cell Values (p. 1635) for details.

Auto Range
specifies that the minimum and maximum values of the scalar field will be the limits of that field. If
this option is not selected, you can enter Min and Max values manually. These values determine the
range of the color scale.

Draw Mesh
when enabled opens the Mesh Display Dialog Box (p. 1891) where you can specify how to display your
mesh.

Accuracy Control
allows you to specify tolerance to control the pathlines accuracy.
Relative Pathlines
allows you to display the pathlines relative to the rotating reference frame.

XY Plot
enables the display of an XY plot along the pathline trajectories. When this option is selected, the Display push button will change to Plot.

Write to File
activates the file-writing option. When this option is selected, the Type option becomes active and the Plot push button will change to Write.... Clicking on the Write... button will open The Select File Dialog Box (p. 15), in which you can specify a name and save a file containing the XY plot data. The format of this file is described in XY Plot File Format (p. 1707).

Type
specifies the type of the file you want to write.

CFD-Post
allows you to write the file in CFD-Post compatible format, which can be read in CFD-Post.

Fieldview
allows you to write the file in FIELDVIEW format, which can be read in FIELDVIEW.

Geometry
allows you to write the file in .ibl format, which can be read in GAMBIT.

EnSight
allows you to write the file in .encas format, which can be read in EnSight.

Pulse Mode
specifies either a single or continuous release of particles that follow the pathlines, starting at the release surface, when you use the Pulse button to animate the pathlines.

Continuous
sets the pulse mode to continuously release particles from the initial positions.

Single
sets the pulse mode to release a single wave of particles.

The Pulse Mode is used only when particles are being pulsed.

Style
sets the pathline style. Pathlines can be displayed as lines, ribbons, spheres, cylinders, or a set of points. The ribbon style also uses the Twist By field and the TwistFactor value (specified in the Ribbon Attributes Dialog Box (p. 2296)). Pulsing can be done only on point or line styles.

Attributes...
opens the Path Style Attributes Dialog Box (p. 2296) or the Ribbon Attributes Dialog Box (p. 2296), depending on the selected Style. These dialog boxes let you set the attributes (ribbon width, marker size, cylinder radius, twist-by field, and so on) for the chosen pathline style.

Step Size
sets the interval used for computing the next position of a particle. This is in units of length. Particle positions are always computed when they enter/leave a cell. If you specify a very large size, the particle positions at entry/exit of each cell will still be computed (and displayed).
Tolerance allows you to control the error when using large time step sizes for the calculation. This is available when Accuracy Control is selected under Options.

Steps sets the maximum number of steps a particle can advance. A particle’s path may also end if it leaves the domain.

Path Skip allows you to “thin” or “sample” the pathlines that are displayed. See “Thinning” Pathlines (p. 1630) for details.

Path Coarsen reduces the time and the number of points plotted in a pathline. Coarsening factor of ‘n’ will result in plotting of each ’n’th point for a given pathline in each cell.

On Zone contains a list from which you can select the zone on which the particles are constrained to lie. This list is activated only when the Oil Flow option is selected.

Color by contains a list from which you can select the scalar field to be used to color the pathlines. The default is Particle ID, a unique ID for each particle.

Y Axis Function contains a list of solution variables that can be used for the y axis of the plot.

This item appears when the XY Plot option is turned on.

X Axis Function contains a list of functions for the x axis of the plot. You can plot the quantity selected in the Y Axis Function drop-down list as a function of the Time elapsed along the trajectory, or the Path Length along the trajectory.

This item appears when the XY Plot option is turned on.

Min/Max display the values to which the lower and upper ends of the color scale map. If you are using the Auto Range option, these values will be automatically computed when you click Compute. If you are not using Auto Range, you can enter values manually.

Release from Surfaces selects the surfaces from which to release particles. You must select at least one surface before any particles can be released.

Highlight Surfaces when enabled highlights the surfaces (selected in the Pathlines dialog box) in the graphics window.

New Surface is a drop-down list button that contains a list of surface options:

Point opens the Point Surface Dialog Box (p. 2239).
Line/Rake
opens the Line/Rake Surface Dialog Box (p. 2240).

Plane
opens the Plane Surface Dialog Box (p. 2241).

Quadric
opens the Quadric Surface Dialog Box (p. 2243).

Iso-Surface
opens the Iso-Surface Dialog Box (p. 2245).

Iso-Clip
opens the Iso-Clip Dialog Box (p. 2246).

EnSight Encas File Name
allows you to specify a.encas file name if you selected EnSight under Type.

Browse...
opens the The Select File Dialog Box (p. 15) where you can select the .encas file.

Time Steps For EnSight Export
allows you to set the number of time levels that are available for animation in EnSight.

Display
displays the pathlines and records all dialog box settings.

Plot
displays an XY plot along the pathline trajectories. This button replaces the Display button when the XY Plot option is turned on.

Write...
opens The Select File Dialog Box (p. 15), in which you can save the XY plot data to a file. This button replaces the Plot button when the Write to File option is turned on.

Pulse
animates the position of particles. If Pulse Mode is set to Continuous, particles are reintroduced at the seed positions repeatedly. If the mode is Single, a single wave of particles moves through the domain.

The label of this button changes to Stop! when the animation is in progress. Click Stop! to stop pulsing (and the label goes back to Pulse).

Compute
computes the Min and Max for the field chosen in Color by.

Axes...
opens the Axes Dialog Box (p. 2347), which allows you to customize the XY plot axes. This item appears when the XY Plot option is turned on.

Curves...
opens the Curves Dialog Box (p. 2349), which allows you to customize the curves used in the XY plot. This item appears when the XY Plot option is turned on.
35.20.8. Path Style Attributes Dialog Box

To modify the line width, cylinder radius or marker size, use the Path Style Attributes dialog box. You can open this dialog box by clicking the Attributes... button in the Pathlines Dialog Box (p. 2291). See Controlling the Pathline Style (p. 1629) for details about the items below.

**Controls**

**Line Width/Marker Size/Width/**

determines the thickness of the pathlines.

**Diameter**

specifies the diameter of the sphere. This parameter appears only when sphere is selected under Style in the Pathlines dialog box.

**Spacing Factor**

controls the spacing of arrows when you use the line-arrows style.

**Scale**

controls the size of the arrow heads when you use the line-arrows style.

**Detail**

specifies the detail applied to the graphical rendering of the spheres. This parameter appears only when sphere is selected under Style in the Pathlines dialog box.

35.20.9. Ribbon Attributes Dialog Box

To modify the ribbon width and set the scalar field by which to twist the ribbon, use the Ribbon Attributes dialog box. You can open this dialog box by clicking the Attributes... button in the Pathlines Dialog Box (p. 2291) when the selected Style is ribbon. See Controlling the Pathline Style (p. 1629) for details about the items below.
Controls

**Width**

determines the thickness of the ribbon.

**Twist Scale**

sets the amount of twist for a given field. To magnify the twist for a field with very little change, increase this factor; to display less twist for a field with dramatic changes, decrease this factor.

**Twist By**

contains a drop-down list from which you can select a scalar field on which pathline twisting is based.

**Min/Max**

displays the minimum/maximum value of the scalar field selected in **Twist By**.

### 35.20.10. Particle Tracks Dialog Box

The **Particle Tracks** dialog box controls the generation and display of discrete phase particles. See [Displaying of Trajectories (p. 1210)](#) for details about the items below.
Controls

Options contains the options described below:

**Node Values**
- specifies that node values should be interpolated to compute the scalar field at a particle location. This option is turned on by default. See Choosing Node or Cell Values (p. 1635) for details.

**Auto Range**
- specifies that the minimum and maximum values of the scalar field will be the limits of that field. If this option is not selected, you can enter Min and Max values manually. These values determine the range of the color scale.

**Draw Mesh**
- toggles between displaying and not displaying the mesh. The Mesh Display Dialog Box (p. 1891) is opened when Draw Mesh is selected.

**XY Plot**
- enables the display of an XY plot along the particle trajectories. When this option is selected, the Display push button will change to Plot.

**Write to File**
- (available only when XY Plot is on) activates the file-writing option. When this option is selected, the Plot push button will change to Write. Clicking on the Write button will open The Select File Dialog Box (p. 15), in which you can specify a name and save a file containing the XY plot data. The format of this file is described in XY Plot File Format (p. 1707).
Enable Filter
when activated allows you to click the Filter by....

Filter by...
opens the Particle Filter Attributes (p. 2302) where you can specify how you would like to filter the particles being displayed.

Reporting
allows you to specify how you would like to report particle tracks.

Report Type
controls the type of trajectory-fate reports to be displayed.

Off
disables reporting of trajectory fates.

Summary
enables summary reports of trajectory fates. See Reporting of Trajectory Fates (p. 1220) for details.

Step by Step
enables the step-by-step reporting of trajectories. This item will not appear if you have requested unsteady tracking in the Discrete Phase Model Dialog Box (p. 1998). See Step-by-Step Reporting of Trajectories (p. 1227) for details.

Current Positions
enables the reporting of the positions and velocities of all particles that are in the domain at the current time. This item appears only when unsteady tracking has been requested in the Discrete Phase Model Dialog Box (p. 1998). See Reporting of Current Positions for Unsteady Tracking (p. 1229) for details.

Report to
indicates the destination of the trajectory report.

File
enables the writing of the trajectory report to a file. When this option is enabled, the Track button will become the Write... button.

Console
enables the display of the trajectory report information in the console window.

Significant Figures
controls the number of significant figures used when a Step by Step or Current Positions report is selected.

Reporting Variables...
opens the Reporting Variables Dialog Box (p. 2302) that contains a list from which you can select the scalar field to be used to color the particle tracks.

Track Style
sets the trajectory style. Trajectories can be displayed as lines, ribbons, spheres, cylinders, or a set of points. Pulsing can be done only on point or line styles.
Attributes... opens the Track Style Attributes Dialog Box (p. 2303), Particle Sphere Style Attributes Dialog Box (p. 2304), or the Ribbon Attributes Dialog Box (p. 2296), depending on the selected Track Style. These dialog boxes let you set the attributes for the chosen trajectory style.

Vector Style sets the trajectory vector style. You can display the trajectories vectors in three different ways: vector, centered-vector, and centered-cylinder. All three styles are demonstrated in Controlling the Vector Style of Particle Tracks (p. 1214).

Attributes... opens the Particle Vector Style Attributes Dialog Box (p. 2305).

Pulse Mode specifies either a single or continuous release of particles that follow the trajectories, starting at the release surface, when you use the Pulse button to animate the trajectories.

Continuous sets the pulse mode to continuously release particles from the initial positions.

Single sets the pulse mode to release a single wave of particles.

The Pulse Mode is used only when particles are being Pulsed.

Y Axis Function contains a list of solution variables that can be used for the y axis of the plot.

This item appears when the XY Plot option is turned on.

X Axis Function contains a list of functions for the X-axis of the plot. You can plot the quantity selected in the Y Axis Function drop-down list as a function of the Time elapsed along the trajectory, or the Path Length along the trajectory.

This item appears when the XY Plot option is turned on.

Min/Max display the values to which the lower and upper ends of the color scale map. If you are using the Auto Range option, these values will be automatically computed when you click Compute. If you are not using Auto Range, you can enter values manually.

Update Min/Max computes the Min and Max for the field chosen in Color by.

Track PDF Transport Particles enables the tracking of PDF transport particles. This item is available only when the composition PDF transport model is enabled.

Free Stream Particles enables the tracking of free stream particles. Note that this option is available only when the Lagrangian wallfilm model is enabled in the wall boundary conditions dialog box, under the DPM tab.
Wall Film Particles
enables the tracking of wall film particles. Note that this option is available only when the Lagrangian wallfilm model is enabled in the wall boundary conditions dialog box, under the DPM tab.

Track Single Particle Stream
enables the tracking of a single particle stream in the selected injection, instead of all the streams in that injection. See Specifying Particles for Display (p. 1212) for details.

Stream ID
specifies the particle stream to be tracked when the Track Single Particle Stream option is enabled.

Skip
allows you to “thin” or “sample” the particles that are displayed.

Coarsen
reduces the plotting time by reducing the number of points that are plotted for a given trajectory in any cell. This is valid only for steady-state cases.

Release from Injections
selects the injections from which to release particles. You must select at least one injection before any particles can be released.

Display
displays the trajectories and generates a trajectory report in the console window (if requested).

Plot
displays an XY plot along the particle trajectories. This button replaces the Display button when the XY Plot option is turned on.

Write...
opens The Select File Dialog Box (p. 15), in which you can save the XY plot data or trajectory report to a file. This button replaces the Plot button when the Write to File option is turned on, or the Track button when the File option is selected under Report to.

Pulse
animates the position of particles. If Pulse Mode is set to Continuous, particles are reintroduced at the seed positions repeatedly. If the mode is Single, a single wave of particles moves through the domain.

The label of this button changes to Stop ! when the animation is in progress. Click Stop ! to stop pulsing (and the label goes back to Pulse).

Track
computes the particle trajectories and generates any reports without displaying the trajectories in the graphics window.

Axes...
opens the Axes Dialog Box (p. 2347), which allows you to customize the XY plot axes. This item appears when the XY Plot option is turned on.

Curves...
opens the Curves Dialog Box (p. 2349), which allows you to customize the curves used in the XY plot. This item appears when the XY Plot option is turned on.
35.20.11. Particle Filter Attributes

The **Particle Filter Attributes** dialog box allows you to specify how you would like to filter the particles being displayed. See **Particle Filtering (p. 1220)** for details about the items below.

![Particle Filter Attributes Dialog Box](image)

**Controls**

**Options**
contains the filtering options.

**Inside**
enables the filtering of particles with values between **Filter-Min** and **Filter-Max**.

**Outside**
enables the filtering of particles with values less than **Filter-Min** or greater than **Filter-Max**.

**Filter by**
contains a list from which you can select any field variable, except for **Custom Field Functions...**, to be used as a filter variable.

**Min/Max**
displays the minimum and maximum values of the selected field variable. The real number field values are not editable; they are purely informational.

**Filter-Min/Filter-Max**
defines the minimum/maximum filter threshold.

35.20.12. Reporting Variables Dialog Box

The **Reporting Variables** dialog box allows you to control the particle variables that you include in your reporting. See **Step-by-Step Reporting of Trajectories (p. 1227)** for details about the items below.
Controls

Variables in Report
contains all variables currently in the report.

Remove
removes the selected variable from the report.

Default Variables
restores the default list.

Available Particle Variables
contains the particle variables that are available for you to select.

Add Variables
takes the selected variable from the Available Particle Variables list and adds it to the Variables in Report list.

Add Color By
adds the Color by variable to the Variables in Report list.

35.20.13. Track Style Attributes Dialog Box

To modify the line width, cylinder radius or marker size, use the Track Style Attributes dialog box. You can open this dialog box by clicking the Attributes... button in the Particle Tracks Dialog Box (p. 2297). See Controlling the Particle Tracking Style (p. 1212) for details about the items below.
Controls

Line Width/Marker Size/Width
determines the thickness of the particle tracks.

Spacing Factor
controls the spacing of arrows when you use the line-arrows style.

Scale
controls the size of the arrow heads when you use the line-arrows style.

35.20.14. Particle Sphere Style Attributes Dialog Box

To modify the attributes of the particle sphere, use the Particle Sphere Style Attributes dialog box. Select sphere from the Track Style drop-down list and click the Attributes... button in the Particle Tracks Dialog Box (p. 2297) to open the Particle Sphere Style Attributes dialog box. See Controlling the Particle Tracking Style (p. 1212) for details about the items below.

Controls

Options
allows you to choose how you would like to specify the particle diameter.

Constant
allows you to specify the diameter as a constant value.
**Variable**
allows you to select a particle variable to estimate the size of the spheres.

**Auto Range**
when disabled clips the displayed particles to the values given in Min and Max.

**Diameter**
specifies the diameter of the sphere.

**Scale**
allows you to scale the spheres by the factor entered in this field.

**Detail**
specifies the detail applied to the graphical rendering of the spheres.

**Size by**
contains a list of variables by which you can estimate the size of your particle. This list is selectable only when you are using the **Variable** option.

**Min/Max**
defines the minimum and maximum values of the selected field variable to display.

---

**35.20.15. Particle Vector Style Attributes Dialog Box**

To modify the attributes of the vector styles, use the **Particle Vector Style Attributes** dialog box. See Controlling the Vector Style of Particle Tracks (p. 1214) for details about the items below.

---

### Controls

**Options**
allows you to choose how you would like to specify the particle diameter.

- **Constant Length**
  allows you to specify the vector length as a constant value.

- **Variable Length**
  results in a vector length that is based on the variable selected under **Length by**.
**Constant Color**  
When enabled allows you to select a vector color from the Color drop-down list. Otherwise, the vector is colored based on the variable selected in the Particle Tracks dialog box (seen in the Mesh Colors dialog box when Draw Mesh is enabled).

**Length**  
Specifies the length of the vector.

**Scale**  
Allows you to scale the vectors by the factor entered in this field.

**Length to Head Ratio**  
Is the ratio of vector length to vector head size.

**Vectors of**  
Contains the particle vector variable to display.

**Length by**  
Is used to estimate the length of the vector when the Variable Length option is enabled.

### 35.20.16. Sweep Surface Dialog Box

The **Sweep Surface** dialog box controls the display and animation of mesh, contour, and vector plots generated on a sweep surface. See **Displaying Results on a Sweep Surface (p. 1635)** for details about the items below.

![Sweep Surface Dialog Box](image)

**Controls**

**Sweep Axis**  
Specifies the \((X, Y, Z)\) vector representing the axis along which the surface should be swept.

**Display Type**  
Specifies the type of display to be swept through the domain (**Mesh, Contours, or Vectors**).
Properties... opens the Contours Dialog Box (p. 2283) if Contours is the selected Display Type, or the Vectors Dialog Box (p. 2286) if Vectors is the selected Display Type. (This button is not available if Mesh is the selected Display Type.)

Animation contains controls for animating the sweep-surface display.

Initial Value, Final Value specify the initial and final positions for the animation.

Frames specifies the number of frames in the animation.

Min Value, Max Value show the minimum and maximum extents of the domain along the specified Sweep Axis. These values are updated when you click Compute.

Value shows the current position at which the requested display is plotted. You can change the value by moving the slide bar below it, or by entering a new value and pressing the <RETURN> key.

Create... opens the Create Surface Dialog Box (p. 2307), where you can create a surface from the currently-displayed sweep surface.

Animate animates the display, sweeping the requested display through the domain along the specified axis.

Compute updates the Min Value and Max Value to reflect the minimum and maximum extents of the domain along the specified Sweep Axis.

35.20.17. Create Surface Dialog Box

The Create Surface dialog box allows you to save a sweep surface for later use. You can open it by clicking Create... in the Sweep Surface Dialog Box (p. 2306). See Displaying Results on a Sweep Surface (p. 1635) for details about the items below.

Controls

Surface Name specifies a name for the surface to be created.
35.20.18. Animate Dialog Box

The Animate dialog box allows you to specify key frames that define the basic movement of an animated sequence, and then play back the animation. ANSYS Fluent interpolates between your specified key frames. See Animating Graphics (p. 1682) for details about the items below.

**Controls**

**Playback** contains the controls that you use to play back the animation. See Playing an Animation (p. 1683) for details.

- **Playback Mode** contains a drop-down list of playback options.
  - **Play Once** sets the option to play back frames from **Start Frame** to **End Frame** once.
  - **Auto Repeat** sets the option to continually play back frames from **Start Frame** to **End Frame**.
  - **Auto Reverse** sets the option to continually play back the images while reversing playback direction after each set.

- **Start Frame, End Frame** set the frames at which the animation should begin and end. By changing these numbers you can view a subset of the frames.

- **Increment** sets the number of frames to increment the frame-counter by when you use the fast-forward or fast-reverse buttons.

- **Frame** shows the number of the frame that is currently displayed, as well as its relative position in the entire animation. If you slide the bar to a different location, the frame corresponding to the new frame number will be displayed in the graphics window.
(Tape Player Buttons)
allow you to play the animation forward and backward, fast-reverse and fast-forward the animation,
and stop it. The buttons function in a way similar to those on a standard video cassette player.

Key Frames
contains the controls that you use to define the key frames for the animation. See Creating an Anima-
tion (p. 1683) for details.

Frame
sets the number to be assigned to the next key frame added to the list of Keys.

Keys
contains a list of the key frames that have been defined. If you select a key frame in this list, the as-
associated scene will be displayed in the graphics window.

Add
creates a key frame with the number shown in Frame for the scene currently displayed in the
graphics window.

Important
Be sure to change the frame number before you add the new key frame so that you
will not overwrite the last key frame that you created.

Delete
deletes the key frame that is selected in the Keys list.

Delete All
deletes all key frames in the Keys list.

Write/Record Format
specifies Key Frames, Picture Files, MPEG, or Video (not available on Windows) as the format in which
to save the animation. See Saving an Animation (p. 1685) for details about these options.

Picture Options...
opens the Save Picture Dialog Box (p. 2309), in which you can specify parameters for saving the animation
to picture files. This button is available only when Picture Files is selected as the Write/Record Format.

Write...
opens The Select File Dialog Box (p. 15), in which you can specify a name for the animation file and
save it.

Read...
opens the Select File dialog box, in which you can specify the name of the animation file to be read.
Note that the current case and data should contain the surfaces and any other information that the key
frame description refers to. See Reading an Animation File (p. 1686).

35.20.19. Save Picture Dialog Box

The Save Picture dialog box allows you to set save picture parameters and save picture files of graphics
windows. See Saving Picture Files (p. 102) for details on the use of this dialog box.
Controls

Format

allows you to select the format of picture files.

EPS

(Encapsulated PostScript) output is the same as PostScript output, with the addition of Adobe Document Structuring Conventions (v2) statements. Currently, no preview bitmap is included in EPS output. Often, programs that import EPS files use the preview bitmap to display on-screen, although the actual vector PostScript information is used for printing (on a PostScript device). You can save EPS files in raster or vector format.

JPEG

is a common raster file format.

PPM

output is a common raster file format.

PostScript

is a common vector file format. You can also choose to save a PostScript file in raster format.

TIFF

is a common raster file format.

PNG

is a common raster file format.

VRML

is a graphics interchange format that allows export of 3D geometrical entities that you can display in the ANSYS Fluent graphics window. This format can commonly be used by VR systems and in particular the 3D geometry can be viewed and manipulated in a web-browser graphics window.

Important

Non-geometric entities such as text, titles, color bars, and orientation axis are not exported. In addition, most display or visibility characteristics set in ANSYS Fluent, such as lighting, shading method, transparency, face and edge visibility, outer face culling, and hidden line removal, are not explicitly exported but are controlled by the software used to view the VRML file.
Window Dump
(Linux systems only) selects a window dump operation for generating the picture. With this format, you will need to specify the appropriate **Window Dump Command**.

Coloring
(all formats except Window Dump) specifies the color mode for the picture file.

**Color**
specifies a color-scale copy.

**Gray Scale**
specifies a gray-scale copy.

**Monochrome**
specifies a black-and-white copy.

---

**Important**
Most monochrome PostScript devices will render **Color** images in shades of gray, but to ensure that the color ramp is rendered as a linearly-increasing gray ramp, you should select **Gray Scale**.

---

File Type
specifies the type of picture file to be saved. See [Choosing the File Type](p. 104) for details.

**Raster**
specifies a raster type picture. The supported raster formats are **EPS**, **JPEG**, **PPM**, **PostScript**, **TIFF**, and **PNG**.

**Vector**
specifies a vector type picture. The supported vector formats are **EPS**, **PostScript**, and **VRML**.

Resolution
specifies the resolution or the size (in pixels) of the picture.

**DPI**
specifies the resolution of **EPS** and **PostScript** files in dots per inch (DPI). The default value for **DPI** is set to 75.

**Width**
specifies the width of the raster picture image.

**Height**
specifies the height of the raster picture image.

*The default value for Width and Height is set to zero, so that the default picture is generated at the same resolution as the active graphics window.*

**Options**
contains additional options for all picture formats except Window Dump.

**Landscape Orientation**
specifies the orientation of the picture. If this option is enabled, the picture is made in landscape mode; otherwise, it is made in portrait mode.
**White Background**
controls the foreground/background color. If this option is enabled, the foreground and background colors of graphics windows being saved as pictures will be swapped. Hence, it allows you to save pictures with a white background and a black foreground, while the graphics windows are displayed with a black background and white foreground.

**Window Dump Command**
(UNIX systems only) specifies the command to be used to save the picture file, when you select the Window Dump format. See Window Dumps (UNIX Systems Only) (p. 105) for details.

**Save...**
opens The Select File Dialog Box (p. 15), in which you can specify a name for the picture file to be saved and then save the file. The resulting file will contain a picture of the active graphics window.

**Apply**
saves the current settings. ANSYS Fluent will use these settings when making subsequent pictures.

**Preview**
applies the current settings to the active graphics window so that you can investigate the effects of different options interactively before saving the final picture.

### 35.20.20. Playback Dialog Box

The Playback dialog box allows you to play back an animation sequence. See Playing an Animation Sequence (p. 1514) for details about the items below.

#### Controls

**Playback**
contains the controls that you use to play back the selected animation sequence.

**Playback Mode**
contains a drop-down list of playback options.
Play Once
sets the option to play back frames from Start Frame to End Frame once.

Auto Repeat
sets the option to continually play back frames from Start Frame to End Frame.

Auto Reverse
sets the option to continually play back the images while reversing playback direction after each set.

Start Frame, End Frame
set the frames at which the animation should begin and end. By changing these numbers you can view a subset of the frames.

Increment
sets the number of frames to increment the frame-counter by when you use the fast-forward or fast-reverse buttons.

Frame
shows the number of the frame that is currently displayed, as well as its relative position in the entire animation. If you slide the bar to a different location, the frame corresponding to the new frame number will be displayed in the graphics window.

(Tape Player Buttons)
allow you to play the animation forward and backward, fast-reverse and fast-forward the animation, and stop it. The buttons function in a way similar to those on a standard video cassette player.

Replay Speed
controls the playback speed for the animation. Move the Replay Speed slider bar to the left to reduce the playback speed (and to the right to increase it).

Animation Sequences
contains the controls that you use to define the sequence to be played back.

Sequences
contains a list of the animation sequences that have been defined.

Delete
deletes the animation sequence that is selected in the Sequences list.

Delete All
deletes all animation sequences in the Sequences list.

Write/Record Format
specifies Animation Frames, Picture Files, or MPEG as the format in which to save the animation. See Saving an Animation Sequence (p. 1516) for details about these options.

Picture Options...
opens the Save Picture Dialog Box (p. 2309), in which you can specify parameters for saving the animation to picture files. This button is available only when Picture Files is selected as the Write/Record Format.

Write
saves the specified file(s) in the current working directory.
Read...

opens The Select File Dialog Box (p. 15), in which you can specify the name of the solution animation file to be read. See Reading an Animation Sequence (p. 1518) for details.

### 35.20.21. Display Options Dialog Box

The Display Options dialog box provides an interactive mechanism for setting attributes or options that control how and where a scene is rendered.

![Display Options Dialog Box](image)

#### Controls

**Rendering**

allows you to modify characteristics of the display that are related to the way in which scenes are rendered. See Modifying the Rendering Options (p. 1652) for details about these items.

- **Line Width**
  
  controls the thickness of lines. The default is 1.

- **Point Symbol**
  
  sets the symbol used for nodes and data points.

- **Animation Option**

  contains a drop-down list of animation options: All and Wireframe. Wireframe uses a wireframe representation of all geometry during mouse manipulation. This option is turned on by default. You should turn it off only if your computer has a graphics accelerator; otherwise the mouse manipulation may be very slow.
**Double Buffering**

turns double buffering on or off, if it is supported by the driver. Double buffering dramatically reduces screen flicker during graphics updates. Note that if your display hardware does not support double buffering and you turn this option on, double buffering will be done in software. Software double buffering uses extra memory.

**Outer Face Culling**

allows you to turn off the display of outer faces in wall zones. **Outer Face Culling** is useful for displaying both sides of a slit wall. By default, when you display a slit wall, one side will “bleed” through to the other. When you turn on the **Outer Face Culling** option, the display of a slit wall will show each side distinctly as you rotate the display. This option can also be useful for displaying two-sided walls (walls with fluid or solid cells on both sides).

**Hidden Line Removal**

turns hidden line removal on or off. If you do not use hidden line removal, ANSYS Fluent will not try to determine which lines in the display are behind others; it will display all of them, and a cluttered display will result. You should turn this option off if you are working with a 2D problem or with geometries that do not overlap. Note that this option is not available when using the **Workbench Color Scheme**.

**Hidden Surface Removal**

turns hidden surface removal on or off. If you do not use hidden surface removal, ANSYS Fluent will not try to determine which surfaces in the display are behind others; it will display all of them, and a cluttered display will result. You should turn this option off if you are working with a 2D problem or with geometries that do not overlap.

**Removal Method**

chooses the method to be used for hidden surface removal. These options vary in speed and quality, depending on the device you are using. The choices are listed below.

- **Hardware Z-buffer**
  
is the fastest method if your hardware supports it. The accuracy and speed of this method is hardware dependent.

- **Painters**
  
will show fewer edge-aliasing effects than hardware-z-buffer. This method is often used instead of software-z-buffer when memory is limited.

- **Software Z-buffer**
  
is the fastest of the accurate software methods available (especially for complex scenes), but it is memory intensive.

- **Z-sort only**
  
is a fast software method, but it is not as accurate as software-z-buffer.

**Timeout in seconds**

specifies the value for the timeout.

**Graphics Window**

allows you to open and close graphics windows. See **Opening Multiple Graphics Windows (p. 1639)** for details.
**Active Window**
indicates the graphics window to be opened, closed, or set active. (A graphics window’s ID is displayed in its title.)

**Open/Close**
opens or closes the window with the ID shown in the Active Window box. If the indicated window is open, the Close button will appear, and if the indicated window is not open, the Open button will appear.

**Set**
sets the window with the ID shown in the Active Window box to be the active graphics window. See Setting the Active Window (p. 1640) for details.

**Color Scheme**
contains a drop-down list of available graphics window color schemes to choose from. Choices are Workbench (blue background) and Classic (black background).

**Lighting Attributes**
controls lighting attributes for all lights in the active graphics window. See Adding Lights (p. 1650) for details.

**Lights On**
turns all lights in the active graphics window on or off.

**Lighting**
specifies the method to be used in lighting interpolation: Flat, Gouraud, or Phong. (Flat is the most basic method: there is no interpolation within the individual polygonal facets. Gouraud and Phong have smoother gradations of color because they interpolate on each facet.)

**Layout**
controls the display of captions, axes and the colormap in the graphics display window. See Changing the Legend Display (p. 1640) for details.

**Titles**
enables/disables the display of all captions in the graphics display window.

**Axes**
enables/disables the display of the axis triad.

**Logo**
allows you to hide or display the ANSYS logo.

**Color**
contains a drop-down list of colors that can be used for the logo. The choices are White (default) or Black.

**Colormap**
enables/disables the display of the color scale.

**Colormap Alignment**
allows you to adjust the alignment of colormap in the graphics display. Select the side (Top, Bottom, Left, and Right) from the drop-down list, where you want to align the colormap.
Apply
applies the specified attributes and re-renders the scene in the active graphics window with the new attributes. To see the effect of the new attributes on other graphics windows, you must redisplay them.

Info
prints out information about your graphics driver in the console.

Lights...
opens the Lights Dialog Box (p. 2328), which allows you to create, delete, and modify directional light sources.

35.20.22. Scene Description Dialog Box

The Scene Description dialog box allows you to turn overlays on and off, select geometric objects in the display for modification or deletion, and open dialog boxes that control various characteristics of the selected object(s). (Note that you cannot use the Scene Description dialog box to control XY plot and histogram displays.) See Composing a Scene (p. 1673) for details about the items below.

Controls

Names
contains a list of the geometric objects that currently exist in the scene (including those that are presently invisible). You can specify the object or objects to be manipulated by selecting names in this list. If you select more than one object at a time, any operation (transformation, color specification, and so on) will apply to all the selected objects. You can also select objects by clicking on them in the graphics display using the mouse probe button, which is, by default, the right mouse button. (See Controlling the Mouse Button Functions (p. 1654) for information about mouse button functions.) To deselect a selected object, simply click its name in the Names list. See Selecting the Object(s) to be Manipulated (p. 1674) for details.

Geometry Attributes
contains information about the type of the selected geometric object and push buttons that open dialog boxes for modifying the object.

Type
reports the type of the selected object. Possible types include mesh, surface, contour, vector, and Group. This information is especially helpful when you need to distinguish two or more objects with the same name. When more than one object is selected, the type displayed is Group.
Display...
opens the Display Properties Dialog Box (p. 2318), which allows you to change the color, visibility, and other properties for the selected object.

Transform...
opens the Transformations Dialog Box (p. 2320), which allows you to translate, rotate, and scale the selected object.

Iso-Value...
opens the Iso-Value Dialog Box (p. 2321), which allows you to change the isovalue of an isosurface. This push button is available only if the geometric object selected in the Names list is an isosurface or an object on an isosurface (contour on an isosurface, for example); otherwise it is grayed out.

Pathlines...
opens the Pathline Attributes Dialog Box (p. 2322), which allows you to set the maximum number of steps for the selected pathlines. This is most useful in animating the path of a set of particles.

Scene Composition
contains controls for enabling overlays and bounding frames.

Overlays
activates the superimposition of a new geometry onto a currently displayed geometry. See Overlay of Graphics (p. 1638) for details.

Draw Frame
activates the display of a bounding frame in the graphics display. See Adding a Bounding Frame (p. 1680) for details.

Frame Options...
opens the Bounding Frame Dialog Box (p. 2322), in which you can define properties of the bounding frame. See Adding a Bounding Frame (p. 1680) for details.

Delete Geometry
deletes the geometric object that is currently selected in the Names list. The ability to delete individual objects is especially useful if you have overlays on and you generate an unwanted object (for example, if you generate contours of the wrong variable). You can simply delete the unwanted object and continue your scene composition, instead of starting over from the beginning.

Apply
saves the status of Overlays and Draw Frame. When you turn Overlays or Draw Frame on or off, you must click the Apply button to see the effect of the change on subsequent display operations.

35.20.23. Display Properties Dialog Box

To modify the color, visibility, and other display properties for individual geometric objects in the graphics display, use the Display Properties dialog box. You can open this dialog box by clicking the Display... push button in the Scene Description Dialog Box (p. 2317). See Changing an Object’s Display Properties (p. 1674) for details about the items below.
Controls

Geometry Name

displays the name of the object you selected for modification in the Scene Description Dialog Box (p. 2317).

Visibility

contains check buttons that control options related to the visibility of the selected object. See Controlling Visibility (p. 1675) for details.

Visible
toggles the visibility of the selected object. If it is turned on, the object will be visible in the display, and if it is turned off, the object will be invisible.

Lighting
turns the effect of lighting for the selected object on or off. You can choose to have lighting affect only certain objects instead of all of them. Note that if Lighting is turned on for an object such as a contour or vector plot, the colors in the plot will not be exactly the same as those in the colormap at the left of the display.

Faces
toggles the filled display of faces for the selected mesh or surface object. Turning Faces on has the same effect as turning on the display of faces in the Mesh Display Dialog Box (p. 1891).

Outer Faces
toggles the display of outer faces.

Edges
toggles the display of interior and exterior edges of the geometric object.

Perimeter Edges
toggles the display of the outline of the geometric object. (This option has no effect on the display of meshes.)
**Feature Edges**
toggles the display of feature lines (if any) of the geometric object.

**Lines**
toggles the display of the lines (if any) in the geometric object.

**Nodes**
toggles the display of the nodes (if any) in the geometric object.

**Colors**
contains controls for setting face, edge, line, and node colors, and transparency for faces. See Controlling Object Color and Transparency (p. 1675) for details.

**Color**
specifies the face, edge, line, or node color for modification. When you turn on this button, the color scales below will show the current color specification, which you can modify by moving the sliders on the color scales.

**Red, Green, Blue**
are color scales with which you can specify the RGB components of the face, edge or line color.

**Transparency**
sets the relative transparency of the selected object. An object with a transparency of 0 is opaque, and an object with a transparency of 100 is transparent.

### 35.20.24. Transformations Dialog Box

You can use the Transformations dialog box to translate, rotate, or scale individual objects in the graphics display. To open this dialog box, click the Transform... push button in the Scene Description Dialog Box (p. 2317). See Transforming Geometric Objects in a Scene (p. 1676) for details about the items below.

![Transformations Dialog Box](image.png)

**Controls**

**Geometry Name**
displays the name of the object you selected for modification in the Scene Description Dialog Box (p. 2317).
Meridional
(3D only) enables the display of the meridional view. This option is especially useful in turbomachinery applications.

Translate contains X, Y, and Z real number fields in which you can enter the distance by which to translate the selected object in each direction.

Rotate by contains X, Y, and Z integer number fields in which you can enter the number of degrees by which to rotate the selected object about each axis.

Rotate about specifies the point about which to rotate the object.

Scale contains X, Y, and Z real number fields in which you can enter the amount by which to scale the selected object in each direction. To avoid distortion of the object's shape, be sure to specify the same value for all three entries.

35.20.25. Iso-Value Dialog Box

The Iso-Value dialog box allows you to change the isovalue of an isosurface. The isosurface can be selected directly in the Names list or indirectly by selecting an object displayed on the isosurface. When you change the isovalue, any contours, vectors, and so on that were displayed on the original isosurface will be displayed on the isosurface with the new isovalue. To open this dialog box, click the Iso-Value... push button in the Scene Description Dialog Box (p. 2317). See Modifying Iso-Values (p. 1678) for details about using this dialog box.

Controls

Geometry Name displays the name of the geometric object (isosurface) you selected for modification in the Scene Description Dialog Box (p. 2317).

Min, Max show the minimum and maximum values of the isosurface variable.

Value sets the new isovalue for isosurfaces. After you change the value and click Apply, contours, vectors, or pathlines that were displayed on the original isosurface will be displayed for the new isovalue. You can also use the slide bar to change the Value.
35.20.26. Pathline Attributes Dialog Box

The **Pathline Attributes** dialog box allows you to change the number of steps used in the computation of pathlines. This is most useful in creating animations of pathlines. To open this dialog box, click the **Pathlines...** button in the Scene Description Dialog Box (p. 2317). See Modifying Pathline Attributes (p. 1679) for details about using this dialog box.

**Controls**

**Geometry Name**
- displays the name of the geometric object you selected for modification in the Scene Description Dialog Box (p. 2317).

**Max Steps**
- sets the new maximum number of steps for pathline computation. After you change the value and click **Apply**, the selected pathline will be recomputed and redrawn.

35.20.27. Bounding Frame Dialog Box

The **Bounding Frame** dialog box allows you to add a bounding frame with optional measure markings to the display of the domain. See Adding a Bounding Frame (p. 1680) for details about the items in this dialog box.

**Controls**

**Frame Extents**
- indicates the extents of the bounding frame.

**Domain**
- specifies that the frame should encompass the domain extents.
Display
specifies that the frame should encompass the portion of the domain that is shown in the display.

Axes
contains controls for specifying the frame boundaries and measurements. See Adding a Bounding Frame (p. 1680) for instructions on using these items.

Display
updates the active graphics window with the current frame settings.

35.20.28. Views Dialog Box

With the Views dialog box, you can make various modifications to the view displayed in the active graphics window. See Modifying the View (p. 1660) for details about the items below.

Controls

Views
lists the currently defined views. Clicking on a view name highlights that name and enters it into the Name field. Double-clicking on a view name restores that view in the active graphics window.

Save Name
specifies the name to use when saving a view.

Actions
contains buttons for performing various actions related to the Views list and the Save Name.

Default
restores the “front” view in the active graphics window.

Auto Scale
modifies the view in the active graphics window by scaling and centering the current scene without changing its orientation.

Previous
allows you to return to previous displays.
Save
stores the view in the active graphics window with the name in the Save Name box. See Saving Views (p. 1667) for details.

Delete
removes the selected view name from the Views list.

Important
Be careful not to delete any of the pre-defined views.

Read...
opens The Select File Dialog Box (p. 15), in which you can specify the name of a view file to be read. See Reading View Files (p. 1667) for details.

Write...
opens the Write Views Dialog Box (p. 2324), in which you can select the views to be saved to a view file. See Saving Views (p. 1667) for details.

Mirror Planes
displays a list of all symmetry planes in the domain. Mirror images are drawn for all selected symmetry planes. See Mirroring and Periodic Repeats (p. 1668) for details.

Define Plane...
opens the Mirror Planes Dialog Box (p. 2325), in which you can define a mirror plane for a non-symmetric domain.

Periodic Repeats
indicates the number of periodic repetitions to be displayed. See Mirroring and Periodic Repeats (p. 1668) for details.

Define...
opens the Graphics Periodicity Dialog Box (p. 2326), in which you can define periodicity for a periodic domain.

Camera...
opens the Camera Parameters Dialog Box (p. 2327).

35.20.29. Write Views Dialog Box

The Write Views dialog box allows you to save selected views to a view file. To open it, click Write... in the Views Dialog Box (p. 2323). This feature allows you to transfer views between case files. See Saving Views (p. 1667) for details.
Controls

Views to Write

is a selectable list of the defined views. The selected views will be saved to a view file when you click OK.

35.20.30. Mirror Planes Dialog Box

The Mirror Planes dialog box allows you to define a symmetry plane for a non-symmetric domain for use with graphics. To open it, click Define Plane... in the Views Dialog Box (p. 2323). See Mirroring for Graphics (p. 1672) for details.

Controls

Plane Equation

contains inputs for specifying the equation for the mirror plane: \( A \, X + B \, Y + C \, Z = \text{Distance} \).

Mirror Planes

contains a list of all mirror planes you have defined using this dialog box. (Mirror planes that exist in the domain due to symmetry will not appear in this list, since they cannot be modified.)

Add

adds the plane defined by the Plane Equation to the Mirror Planes list.
Delete
 deletes the plane(s) selected in the **Mirror Planes** list.

### 35.20.31. Graphics Periodicity Dialog Box

The **Graphics Periodicity** dialog box allows you to define a periodic repeats, periodic rotation or translation for a non-periodic domain for use with graphics. To open it, click **Define...** under **Periodic Repeats** in the **Views Dialog Box** (p. 2323). See **Periodic Repeats for Graphics** (p. 1670) for details.

![Graphics Periodicity Dialog Box](image)

**Controls**

**Cell Zones**
contains the list of the zones in the mesh. You can select one or more zones in this list and specify different periodicity parameters for each zone separately.

**Associated Surfaces**
contains the list of the surfaces associated with the selected cell zone.

**Periodic Type**
specifies **Rotational** or **Translational** periodicity.

**Angle**
specifies the angle by which the domain is rotated to create the periodic repeat. This item is available when you select **Rotational** as the **Periodic Type**.

**Translation**
specifies the distance in the **X**, **Y**, and **Z** directions by which the domain is translated to create the periodic repeat. This item will appear when you select **Translational** as the **Periodic Type**.

**Axis Direction**
specifies the direction vector (**X**, **Y**, **Z**) for the axis of rotation. This item is available when you select **Rotational** as the **Periodic Type** and the domain is three-dimensional.
**Axis Origin**
specifies the origin of the axis of rotation. This item is available when you select **Rotational** as the Periodic Type.

**Number of Repeats**
specifies the number of times you want to repeat the periodic domain.

**Set**
applies the periodicity you have defined for the case setup.

**Reset**
removes any periodicity you have defined, and returns to the default periodicity for the domain (no periodicity for a non-periodic domain).

### 35.20.32. Camera Parameters Dialog Box

The **Camera Parameters** dialog box allows you to modify the “camera” through which you are viewing the graphics display. See Controlling Perspective and Camera Parameters (p. 1665) for details about the items below.

![Camera Parameters Dialog Box](image)

#### Controls

**Camera** contains a drop-down list of the parameters that define the camera (**Position, Target, Up Vector, and Field**) and **X**, **Y**, and **Z** fields in which you can define the coordinates or field distances for the parameter selected in the drop-down list. Figure 31.49: Camera Definition (p. 1666) illustrates the definition of the camera by these parameters.

**Projection** contains a drop-down list that allows you to select a **Perspective** or **Orthographic** view.

(Dial and Sliders)
allow you to rotate and scale the graphics display. The slider on the scale to the left of the dial rotates the display about the horizontal axis at the center of the screen, the slider on the scale below the dial rotates the display about the vertical axis at the center of the screen, and the dial controls rotation about the axis at the center of and perpendicular to the screen. The slider on the scale to the right of the dial...
zooms in or out in the display. See Rotating the Display (p. 1662) and Zooming the Display (p. 1664) for details.

**Important**

When you are using the sliders and dial to manipulate the view, you may want to turn off Wireframe Animation in the Display Options Dialog Box (p. 2314), so that you can watch the display move interactively while you are moving the slider or the dial indicator.

### 35.20.33. Lights Dialog Box

The **Lights** dialog box provides an interactive mechanism for placing colored, directional lights in a scene. See Adding Lights (p. 1650) for details about the items below.

**Controls**

**Light ID**
indicates the light that is being added, deleted, or modified. By default, light 1 is defined to be dark gray with a direction of (1,1,1).

**Light On**
indicates whether or not the light specified in **Light ID** is on or off. By turning off the **Light On** option for a particular light, you can remove this light from the display, while still retaining its definition. To add it to the display again, simply turn on the **Light On** button.

**Direction**
allows you to specify the direction of the light (the position on the unit sphere from which the light emanates) by entering the X, Y, and Z coordinates or by computing the coordinates based on the current view in the graphics window.

**X,Y,Z**
specify the direction of the light. For example, the direction (1,1,1) means that the rays from the light will be parallel to the vector from (1,1,1) to the origin.
**Use View Vector**
updates the X,Y,Z fields with the appropriate values for the current view in the active graphics window, and shines a light in that direction. Instead of entering the X,Y,Z values for a light’s direction vector, you can use your mouse to change the view in the graphics window so that your position in reference to the geometry is the position from which you would like a light to shine. You can then click the **Use View Vector** button to update the X,Y,Z fields with the appropriate values for your current position and update the graphics display with the new light direction. This method is convenient if you know where you want a light to be, but you are not sure of the exact direction vector.

**Color**
allows you to specify the light color with sliders. You can create your desired color by increasing and decreasing the slider values for the colors Red, Green, and Blue. You can also enter a descriptive string (for example, lavender) in the **Color** field.

**Active Lights**
shows the position and color of all defined directional lights, and allows you to change the position of a light. All directional lights in ANSYS Fluent are assumed to be at infinity and pass through the unit sphere at the position shown. All light rays arriving at the scene from one light are parallel. The colored markers on the surface of the sphere represent the color and direction of these distant lights. These lights point towards the center of the sphere (the origin, which is usually where the geometry is).

**Lighting Method**
specifies the method to be used in lighting interpolation: Off, Flat, Gouraud, or Phong. (Flat is the most basic method: there is no interpolation within the individual polygonal facets. Gouraud and Phong have smoother gradations of color because they interpolate on each facet.) When Off is selected, lighting effects are disabled.

**Headlight On**
enables constant lighting effects in the direction of the view.

**Reset**
resets the light definitions to their last saved state (the lighting that was in effect the last time you opened the dialog box or clicked on **Apply**).

### 35.20.34. Colormap Dialog Box

The **Colormap** dialog box allows you to select and modify existing colormaps. See [Selecting a Colormap (p. 1646)] for details.
Controls

Labels
allows you to customize the display of your colormap labels.

Show All
Enable this option if you want all the labels to show alongside the colormap. Disable if you want to skip some of the label displays.

Skip
sets the number of labels to be skipped.

Number Format
contains controls for changing the format of the labels on the color scale. These labels are the character strings used to define the color divisions at the left of the graphics window.

Type
sets the form of the labels. You may select from a drop-down list of options, including the following:

- general
displays the real value with either float or exponential form based on the size of the number and the defined Precision.

- float
displays the real value with an integral and fractional part (for example, 1.0000), where the number of digits in the fractional part is determined by Precision.

- exponential
displays the real value with a mantissa and exponent (for example, 1.0e-02), where the number of digits in the fractional part of the mantissa is determined by Precision.

Precision
defines the number of fractional digits displayed in the labels.

Colormap
contains controls for the colormap size and scale, and for selection of a defined colormap.
Log Scale

enables the use of a logarithmic scale for the color scale (rather than the default decimal scale). See Specifying the Colormap Size and Scale (p. 1646) for details.

Colormap Size

specifies the number of distinct colors in the colormap. You may specify from 2 to 100 colors.

Currently Defined

contains a drop-down list of all pre-defined colormaps and all custom colormaps defined by you. Select the colormap to be used from this list.

Edit...

opens the Colormap Editor Dialog Box (p. 2331), in which you can create a custom colormap.

35.20.35. Colormap Editor Dialog Box

The Colormap Editor dialog box allows you to create custom colormaps. See Creating a Customized Colormap (p. 1648) for details about the items below.

Controls

(The Drawing Area)

is used to interactively modify colormaps. You can use the notion of anchor points to interpolate linearly between two defined anchor points. The colors at the top of the dialog box allow you to preview the colormap that is being defined. The black bar and white squares below the colors allow you to set, delete, and modify anchor points.

Color

specifies color components for the currently selected anchor point.
Color Space
gives you a choice of selecting the color specification.

RGB
enables the specification of colors based on their red, green, and blue components.

HSV
enables the specification of colors based on their hue, saturation, and value.

Red, Green, Blue
are scales with which you can specify the RGB components of the selected anchor color. These scales will appear when RGB is selected.

Hue, Saturation, Value
are scales with which you can specify the HSV components of the selected anchor color. These scales will appear when HSV is selected.

Colormap
lists colormap names and the name of the colormap being edited.

Name
sets the name of the colormap being edited/selected. You can rename existing colormaps and provide names for new colormaps.

Currently Defined
contains a drop-down list of all pre-defined colormaps and all custom colormaps defined by you. You can select a colormap to be modified from this list.

Colormap Size
specifies the number of distinct colors in the colormap. You may specify from 2 to 100 colors.

35.20.36. Annotate Dialog Box
You can use the Annotate dialog box to add text with optional attachment lines to the graphics windows, or to modify existing text. See Adding Text Using the Annotate Dialog Box (p. 1642) for details about the items below.
Names
contains a selectable list of all annotation text strings that have been defined. You can choose a text string to be deleted or edited.

Delete Text
deletes the text strings selected in the Names list from the display.

Annotation Text
contains the annotation text string you want to add, or the annotation text string for the item selected in the Names list.

Font Specification
contains controls for defining or modifying the font in the annotation text string.

Name
contains a drop-down list of various font styles.

Weight
contains a drop-down list from which you can select Medium or Bold.

Color
contains a drop-down list of colors that can be used for the text.

Slant
contains a drop-down list from which you can select Regular or Italic as the slant type.

Size
contains a drop-down list of font sizes (in points).

Add
adds the current Annotation Text to the active graphics window. A dialog box will prompt you to select a screen location using the mouse-probe button on your mouse (see Controlling the Mouse Button Functions (p. 1654) for more information on setting the mouse buttons).

Edit
updates the edited text in the active graphics window. This button will replace the Add button when you are editing an existing text string from the Names list.

Clear
removes all annotation text and attachment lines from the active graphics window.

35.21. Plots Task Page

The Plots task page allows you to create plots (XY, histograms, profiles, and so on) of your computational results. See Displaying Graphics (p. 1605) for more information.
## Controls

### Plots

Plots contains a listing of the various plot types available in ANSYS Fluent.

You can double-click an item in the Plots list to open the corresponding dialog box, or you can select the item in the list and click the Set Up... button.

**XY Plot**

selecting this item and clicking the Set Up... button opens the Solution XY Plot Dialog Box (p. 2335).

**Histogram**

selecting this item and clicking the Set Up... button opens the Histogram Dialog Box (p. 2338).

**File**

selecting this item and clicking the Set Up... button opens the File XY Plot Dialog Box (p. 2339).

**Profiles**

two types of profile plots are available:

**Profile Data**

selecting this item and clicking the Set Up... button opens the Plot Profile Data Dialog Box (p. 2340).

**Interpolated Data**

selecting this item and clicking the Set Up... button opens the Plot Interpolated Data Dialog Box (p. 2341).

**FFT**

selecting this item and clicking the Set Up... button opens the Fourier Transform Dialog Box (p. 2342).

**Set Up...**

displays the dialog box corresponding to the selected item in the Plots list.
For additional information, see the following sections:
35.21.1. Solution XY Plot Dialog Box
35.21.2. Histogram Dialog Box
35.21.3. File XY Plot Dialog Box
35.21.4. Plot Profile Data Dialog Box
35.21.5. Plot Interpolated Data Dialog Box
35.21.6. Fourier Transform Dialog Box
35.21.7. Plot/Modify Input Signal Dialog Box
35.21.8. Axes Dialog Box
35.21.9. Curves Dialog Box

35.21.1. Solution XY Plot Dialog Box

The **Solution XY Plot** dialog box allows you to display zone, surface and file data in an XY plot format. See [Steps for Generating Solution XY Plots](p. 1697) for details about the items below.

![Solution XY Plot dialog box](image)

**Controls**

**Options**
contains check buttons that control the presentation of node or cell-averaged values, the selection of axis functions, and the ability to write the plot data to a file.

**Node Values**
toggles the node averaging of the data presented in the plot. If the option is inactive, cell values are presented. See [Choosing Node or Cell Values](p. 1701) for details.

**Position on X Axis, Position on Y Axis**
set the x-axis or y-axis function to be the position. If one of these options is turned on, the other will automatically be turned off. You can turn both options off to generate a plot of one flow-field function vs. another, selecting the function for each axis using the **X Axis Function** and **Y Axis Function** drop-down lists.
Write to File
activates the file-writing option. When this option is selected, the Plot push button will change to Write.... Clicking on the Write... button will open the Select File dialog box (The Select File Dialog Box (p. 15) and The Select File Dialog Box (Windows) (p. 15)), in which you can specify a name and save a file containing the plot data. The format of this file is described in XY Plot File Format (p. 1707).

Order Points
specifies that plot data being saved to a file should be sorted in order of ascending \( x \) axis value. This option is available only when the Write to File option is turned on.

Plot Direction
contains inputs for defining the plot direction.

If Direction Vector (the default) is selected in the X Axis Function or Y Axis Function drop-down list (whichever is the position axis), the inputs are the components of the direction vector. The position axis of the plot will have coordinate values that correspond to the dot product of the data coordinate vector with the plot direction vector. See Steps for Generating Solution XY Plots (p. 1697) for details.

\( X \)
is the component in the \( x \) direction.

\( Y \)
is the component in the \( y \) direction.

\( Z \)
is the component in the \( z \) direction.

If Curve Length is selected in the X Axis Function or Y Axis Function drop-down list (whichever is the position axis), the inputs are the direction along the length of the surface selected in the Surfaces list. See Steps for Generating Solution XY Plots (p. 1697) for details.

Default
specifies the plot direction as the direction of increasing curve length.

Reverse
specifies the plot direction as the direction of decreasing curve length.

Show
displays the selected surface in the graphics window, marking the start of the surface with a blue dot and the end of the surface with a red dot. ANSYS Fluent will also display arrows on the surface showing the direction in which the variable will be plotted.

Y Axis Function, X Axis Function
contain lists of solution variables that can be used for the \( y \) or \( x \) axis of the plot. If the Position on X Axis option is turned on, X Axis Function will become a single drop-down list, containing two options: Direction Vector (to plot the selected variable as a function of position along a specified direction vector) and Curve Length (to plot the selected variable as a function of position along the length of a specified curvilinear surface). See Steps for Generating Solution XY Plots (p. 1697) for details.

Likewise, if Position on Y Axis is turned on, Y Axis Function will become a single drop-down list containing Direction Vector and Curve Length. If both Position on X Axis and Position on Y Axis are turned off, you can select field functions for both axes using the X Axis Function and Y Axis Function lists.
File Data
is a selectable list of the plot titles associated with the loaded external data files. You may choose any number of files for the data plot. The files are loaded using the Load File... push button. The format of these files is presented in XY Plot File Format (p. 1707). See Including External Data in the Solution XY Plot (p. 1701) for details.

Load File...
opens the Select File dialog box (The Select File Dialog Box (p. 15)), in which you can select the plot file to be read. See Including External Data in the Solution XY Plot (p. 1701) for details. After the external file is loaded, its plot title will be displayed in the File Data list.

Free Data
removes the files selected in the File Data list.

Surfaces
is a selectable list of surfaces in the solution domain. You may choose any number of surfaces for the data plot.

New Surface
is a drop-down list button that contains a list of surface options:

Point
opens the Point Surface Dialog Box (p. 2239).

Line/Rake
opens the Line/Rake Surface Dialog Box (p. 2240).

Plane
opens the Plane Surface Dialog Box (p. 2241).

Quadric
opens the Quadric Surface Dialog Box (p. 2243).

Iso-Surface
opens the Iso-Surface Dialog Box (p. 2245).

Iso-Clip
opens the Iso-Clip Dialog Box (p. 2246).

Plot
plots the specified surface and/or file data in the active graphics window using the current axis and curve attributes. If the Write to File option is turned on, this button becomes the Write... button.

Write...
opens the Select File dialog box (The Select File Dialog Box (p. 15)), in which you can save the plot data to a file. This button replaces the Plot button when the Write to File option is turned on.

Axes...
opens the Axes Dialog Box (p. 2347), which allows you to customize the plot axes.

Curves...
opens the Curves Dialog Box (p. 2349), which allows you to customize the curves used in the XY plot.
35.21.2. Histogram Dialog Box

The Histogram dialog box allows you to create histograms of selected geometric or physical data. See Steps for Generating Histogram Plots (p. 1708) for details about the items below.

Controls

Options contains the check buttons for current histogram options.

Auto Range toggles the ability to specify the minimum and maximum range of scalar values in the histogram print or plot. If the option is not active, the Min and Max fields are editable, and you may specify the desired range. If the option is active, the range is defined by the minimum and maximum values in the computational domain.

Global Range toggles the ability to specify the minimum and maximum values on the range of values on the selected surfaces, rather than in the entire domain.

Divisions sets the number of data intervals that will exist in the histogram.

Zone Types contains a list of available face or cell zone types.

Axes... opens the Axes Dialog Box (p. 2347), which allows you to customize the plot axes.

Curves... opens the Curves Dialog Box (p. 2349), which allows you to customize the curves used in the histogram plot.

Histogram of contains a list of scalar quantities that can be used in the histogram.
Min
displays or allows definition of the minimum value of the selected scalar quantity used in the histogram.

Max
displays or allows definition of the maximum value of the selected scalar quantity used in the histogram.

Zones
contains a list of available face or cell zones.

Print
displays the histogram interval.

Plot
displays a plot of the percentage of the total number of cells versus the scalar quantity in the active graphics window.

Compute
computes the minimum and maximum cell values of the selected scalar quantity. The values are displayed in Min and Max.

35.21.3. File XY Plot Dialog Box

The File XY Plot dialog box allows you to display data read from one or more files in an abscissa/ordinate plot form. The format of the plot file is described in XY Plot File Format (p. 1707). See Steps for Generating XY Plots of Data in External Files (p. 1701) for details about the items below.

Controls

Plot Title
displays the current plot title. The default plot title is the y-axis label of the first file read into the dialog box, but you can edit the text entry to change the plot title.

Files
contains a selectable list of loaded file names. If you enter a valid file name into the text entry field below the list and click the Add... button ANSYS Fluent will load the file and update the dialog box. If, however, the file is not found or has already been read, the Select File Dialog Box (p. 15) will be opened.

Legend Title
sets the title of the legend. By default, the legend has no title.
Legend Entries
contains a selectable list of legend labels associated with the loaded files. The default legend label is
the title (first string) in the file. You can modify the legend label by selecting the old name in the Legend
Entries list. It is then displayed in the text entry field below the list and may be edited.

Add...
loads the file named in the Files text entry field or opens the Select File dialog box if no name, a wrong
name, or a duplicate name appears in that text field.

Delete
removes the file selected in the Files list.

Change Legend Entry
changes the legend label of the selected file to the text entered in the text entry field below the Legend
Entries list.

Plot
displays an XY plot of the data associated with every loaded file. You can use the Delete button to remove
files that you do not want to plot.

Aaxes...
opens the Axes Dialog Box (p. 2347), which allows you to customize the plot axes.

Curves...
opens the Curves Dialog Box (p. 2349), which allows you to customize the curves used in the XY plot.

35.21.4. Plot Profile Data Dialog Box

The Plot Profile Data dialog box allows you to display an XY plot of the original data points of a
boundary profile before it is interpolated onto the cell faces of a boundary. See Steps for Generating
Plots of Profile Data (p. 1703) for details about the items below.

Controls

Profile
contains a selectable list of available profiles. When a profile is selected its available fields are displayed
under Y Axis Function.
Y Axis Function
contains a selectable list of the fields available in the selected profile that can be used for the $y$ axis of the plot.

X Axis Function
contains a selectable list of the variables that can be used for the $x$ axis of the plot.

Plot
displays an XY plot of the data points from the selected profile.

Axes...
opens the Axes Dialog Box (p. 2347), which allows you to customize the plot axes.

Curves...
opens the Curves Dialog Box (p. 2349), which allows you to customize the curves used in the XY plot.

35.21.5. Plot Interpolated Data Dialog Box

The Plot Interpolated Data dialog box allows you to display an XY plot of the values assigned to the cell faces when a profile file has been interpolated on a boundary. See Steps for Generating Plots of Interpolated Profile Data (p. 1704) for details about the items below.

Controls

Zones
contains a selectable list of the zones for which a profile field has been set as one or more of the parameters are displayed under Y Axis Function.

Y Axis Function
contains a selectable list of the profile-related parameters in the selected zone that can be used for the $y$ axis of the plot. The name of the parameter will be the same as that of the drop-down list in the boundary condition dialog box from which the profile field was selected.

X Axis Function
contains a selectable list of the geometry variables that can be used for the $x$ axis of the plot.
Plot
displays an XY plot of the cell face values (as interpolated from the data points of the profile file) of the selected zone.

Axes...
opens the Axes Dialog Box (p. 2347), which allows you to customize the plot axes.

Curves...
opens the Curves Dialog Box (p. 2349), which allows you to customize the curves used in the XY plot.

35.21.6. Fourier Transform Dialog Box

The Fourier Transform dialog box allows you to analyze your time dependent data using the Fast Fourier Transform (FFT) algorithm. See Fast Fourier Transform (FFT) Postprocessing (p. 1731) for details about the items below.

Controls

Options
lets you write the FFT data to a file or display the FFT data in a graphics window.

Write FFT to File
allows you to write out the FFT data directly to a file. When selected, the Plot FFT... buttons becomes the Write FFT... button.

Acoustics Analysis
enables the acoustics-relevant spectrum options (sound pressure level spectra and frequency band charts), and specifies that the overall sound pressure level is calculated and displayed in the console when you plot or write the FFT data. All dB-measured quantities are based on the Reference Acoustic Pressure.
**Process Options**
contains options to analyze signal data.

**Process Receiver**
allows you to analyze receiver data stored in memory.

**Process File Data**
allows you to analyze signal data from an existing input file.

**Y Axis Function**
contains a list from which you can select the function for the $y$ axis.

**X Axis Function**
contains a list from which you can select the function for the $x$ axis.

**Receiver**
contains a list of receivers from which you can select when the **Process Receiver** option is enabled.

**Plot/Modify Input Signal...**
opens the Plot/Modify Input Signal Dialog Box (p. 2344), which you can use to plot the input signal, as well as customize the data set and define spectrum smoothing in preparation for applying the FFT algorithm.

**Reference Acoustic Pressure**
allows you to specify the reference acoustic pressure (for example, $p_{\text{ref}}$ in Equation 31.41 (p. 1738)) used to calculate the dB-measured quantities when the **Acoustics Analysis** option is enabled.

**Plot Title**
lets you create a new title or edit the original title for the FFT plot. By default, ANSYS Fluent adds the string “Spectral Analysis of” to the title originally applied to the input signal plot.

**Y Axis Label**
allows you to create a new $y$ axis label or edit the original $y$ axis label. By default, the **Y-axis Label** corresponds to the selection in the **Y Axis Function** drop-down list.

**X Axis Label**
allows you to create a new $x$ axis label or edit the original $x$ axis label. By default, the **X-axis Label** corresponds to the selection in the **X Axis Function** drop-down list.

**Files**
lists the loaded input signal data files.

**Load Input File...**
loads an input signal data file into ANSYS Fluent for FFT analysis. The input file is listed under **Files**.

**Free File Data**
removes data from FFT analysis once the input signal data file is selected in the **Files** list.

**Plot FFT**
displays the FFT data in a graphic window and, if **Acoustics Analysis** is enabled, calculates the overall sound pressure level in dB (based on the **Reference Acoustic Pressure**) and displays it in the console. If the **Write FFT to File** option is selected, then this button becomes the **Write FFT** button, which opens a file selection dialog box so that you write the FFT data to a file.
Write FFT
opens The Select File Dialog Box (p. 15) in which you can specify a name and save the FFT data to a file. If Acoustics Analysis is enabled, the overall sound pressure level will be calculated in dB (based on the Reference Acoustic Pressure) and displayed in the console at this time. If the Write FFT to File option is selected, then the Plot FFT button changes to the Write FFT button.

Axes...
opens the Axes Dialog Box (p. 2347), which allows you to customize the plot axes.

Curves...
opens the Curves Dialog Box (p. 2349), which allows you to customize the curves used in the plot.

35.21.7. Plot/Modify Input Signal Dialog Box
The Plot/Modify Input Signal dialog box allows you to plot the input signal, as well as customize the data set and define spectrum smoothing in preparation for applying the FFT algorithm. It is opened from the Fourier Transform Dialog Box (p. 2342). See Using the FFT Utility (p. 1734) for details about the items below.

![Plot/Modify Input Signal Dialog Box](image)

Controls

Options
allows you to process some or all of the input signal data.

Clip to Range
allows you to analyze a portion of the input signal by specifying data range.
**Subtract Mean Value**  
reduces y axis quantities by the mean value of the relevant signal property.

**Subdivide into Segments**  
enables / disables spectrum smoothing, which can suppress spurious amplitude fluctuations in the Fourier spectrum by splitting the input signal into multiple overlapping segments, so that ANSYS Fluent can apply the FFT algorithm on each segment and then average the resulting spectra. The spectrum smoothing is controlled by the settings in the **Segment Control** group box. See Customizing the Input and Defining the Spectrum Smoothing (p. 1735) for further details.

**Signal Statistics**  
displays signal information.

- **Min**  
displays the minimum value for the input signal.

- **Max**  
displays the maximum value for the input signal.

- **Mean**  
displays the average value for the input signal.

- **Variance**  
displays the variance for the input signal.

- **Number of Samples**  
displays the total number of samples in the input signal data set.

- **Min Frequency**  
displays the finest possible frequency resolution for the input signal.

**X Axis Range**  
allows for a portion of the input signal to be analyzed when the **Process the whole data** option is turned off.

- **Min**  
specifies a minimum value for the x axis.

- **Max**  
specifies a maximum value for the x axis.

**Set Defaults**  
resets the x axis minimum and maximum values to their original value and turns on the **Process the whole data** option.

**Signal Plot Title**  
lets you create a new title or edit the original title for the input signal plot. By default, the **Signal Plot Title** corresponds with the title originally applied to the input signal plot.

**Y Axis Label**  
allows you to create a new y axis label or edit the original y axis label. By default, the **Y-axis Label** corresponds with the y axis label originally applied to the input signal plot.
X Axis Label
allows you to create a new \( x \) axis label or edit the original \( x \) axis label. By default, the X-axis Label corresponds with the \( x \) axis label originally applied to the input signal plot.

Window
lets you specify a windowing technique to remove discontinuities in the FFT calculation.

None
applies no windowing technique. This is the default setting.

Hamming
applies the Hamming technique.

Hanning
applies the Hanning technique.

Barlett
applies the Barlett technique.

Blackman
applies the Blackman technique.

Segment Control
provides settings that control the spectrum smoothing when Subdivide into Segments is enabled.

Control Method
allows you to specify how you want to define the segment size from the following:

Samples
bases the segment size on the Samples per Segment.

Frequency
bases the segment size on the Frequency Resolution \( \Delta f \) in Hertz units.

Samples per Segment
defines the number of samples in each segment when Samples is selected from the Control Method list.

Frequency Resolution
defines the desired frequency resolution \( \Delta f \) in Hertz units when Frequency is selected from the Control Method list.

Overlap
ranges from 0 to 1 and defines how much adjacent segments overlap. This setting is applicable regardless of which Control Method you select.

Apply/Plot
applies any changes you have made in the dialog box and displays the input signal data in a graphics window.

Axes...
opens the Axes Dialog Box (p. 2347), which allows you to customize the plot axes.

Write...
opens The Select File Dialog Box (p. 15), in which you can save the signals to a file.
35.21.8. Axes Dialog Box

The **Axes** dialog box allows you to independently control the characteristics of the ordinate and abscissa on an XY plot or histogram. You can change the labels, scale, range, number format, and major and minor rules visibility and appearance. Note that the title following **Axes** in the dialog box indicates which plot environment you are changing. You can set different parameters for each type of plot that ANSYS Fluent can generate. See **Using the Axes Dialog Box** (p. 1710) for details about the items below.

![Axes - Solution XY Plot](image)

**Controls**

**Axis**
- contains check buttons that allow you to set abscissa (x-axis) or ordinate (y-axis) characteristics.
  - **X** allows you to specify the abscissa characteristics.
  - **Y** allows you to specify the ordinate characteristics.

**Label**
- defines the character string that will label the active axis (the one selected in **Axis**) in the display.

**Options**
- contains check buttons that (de)activate scale, range, major rules, and minor rules.
  - **Log**
    - toggles logarithmic scaling of the active axis. By default, decimal scaling is used.
  - **Auto Range**
    - toggles automatic computation of the range of the active axis. If you deactivate this option, you may input the **Minimum** and **Maximum** values in the **Range** box.
  - **Major Rules**
    - toggles the display of major rules on the active axis. Major rules are the horizontal or vertical lines that mark the primary data divisions and span the whole plot window to produce a “grid.”
Minor Rules
toggles the display of minor rules on the active axis. Minor rules are the horizontal or vertical lines that mark the secondary data divisions and span the whole plot window to produce a “grid.”

Number Format
contains controls for changing the format of the data labels on the active axis. Data labels are the character strings used to define the primary data divisions on the axes.

Type
sets the form of the data labels. You may select from a drop-down list of options, including the following:

- general
displays the real value with either float or exponential form based on the size of the number and the defined Precision.

- float
displays the real value with an integral and fractional part (for example, 1.0000), where the number of digits in the fractional part is determined by Precision.

- exponential
displays the real value with a mantissa and exponent (for example, 1.0e-02), where the number of digits in the fractional part of the mantissa is determined by Precision.

Precision
defines the number of fractional digits displayed in the data labels.

Range
contains the range or extents of the active axis. To set the range manually, you must turn off Auto Range. Otherwise the extents are computed automatically.

Minimum
sets the minimum data value for the active axis.

Maximum
sets the maximum data value for the active axis.

Major Rules
contains controls for modifying the appearance of the major rules. To use these controls you must activate Major Rules in the Options list.

Color
sets the color of the major rules from a drop-down list with numerous color selections.

Weight
sets the line thickness of the major rule. A line of weight 1.0 is normally 1 pixel wide. A weight of 2.0 would make the line twice as thick (2 pixels wide).

Minor Rules
contains controls for modifying the appearance of the minor rules. To use these controls you must activate Minor Rules in the Options list.

Color
sets the color of the minor rules from a drop-down list with numerous color selections.
Weight
sets the line thickness of the minor rule. A line of weight 1.0 is 1 pixel wide. A weight of 2.0 would make the line twice as thick (2 pixels wide).

35.21.9. Curves Dialog Box

The Curves dialog box allows you to modify the appearance of the lines and markers used in XY plots. Note that the title following Curves in the dialog box indicates which plot environment you are changing. You can set different parameters for each type of plot that ANSYS Fluent can generate. See Using the Curves Dialog Box (p. 1712) for details about the items below.

### Controls

**Curve #**
defines the active curve number. The present and future marker and line styles apply to the defined curve number. The curves are numbered sequentially, starting from 0. For example, if you were plotting flow-field values on two zones, the first zone would be curve 0, and the second, curve 1. If the plot contains only one curve, the Curve # is set to 0 and is not editable.

**Sample**
displays a single marker and line with the current style attributes.

**Line Style**
contains controls for modifying the appearance of the active curve.

**Pattern**
sets the pattern of the active curve. A drop-down list allows you to set the line pattern. Except for center and phantom lines, the list displays examples of the pattern choices. A center line alternates a very long dash and a short dash and a phantom line alternates a very long dash and a double short dash.

**Color**
sets the color of the active curve. A drop-down list allows you to select from a list of color names.

**Weight**
sets the thickness of the active curve. A line weight of 1.0 is normally 1 pixel wide. Therefore, a weight of 2.0 would make the line twice as thick (2 pixels wide).
**Marker Style**

contains controls for modifying the appearance of the active curve's marker.

**Symbol**

sets the symbol used to mark data. You can select the symbol from a drop-down list that contains all the symbol choices. The **Sample** box will allow you to experiment with various markers. For example, in plotting pressure-coefficient data on the upper and lower surfaces of an airfoil, the symbol `/` (filled-in upward-pointing triangle) could be used for the marker representing the upper surface data, and the symbol `\` (filled-in downward-pointing triangle) could be used for the marker representing the lower surface data.

**Color**

sets the color of the marker on the active line number. A drop-down list allows you to select from a list of color names.

**Size**

sets the size of the data marker. A symbol of size 1.0 is 3.0% of the height of the display screen, except for the `.` symbol, which is always one pixel.

### 35.22. Reports Task Page

The **Reports** task page allows you to set up reports for your CFD simulation. Reports can be compiled for fluxes, forces, projected areas, surface and volume integrals, among others. See Reporting Alphanumeric Data (p. 1743) for more information.

<table>

</table>

**Controls**

**Reports**

displays a list of available report types in ANSYS Fluent.
You can double-click an item in the **Reports** list to open the corresponding dialog box, or you can select the item in the list and click the **Set Up...** button.

**Fluxes**
selecting this item and clicking the **Set Up...** button opens the **Flux Reports Dialog Box (p. 2352).**

**Forces**
selecting this item and clicking the **Set Up...** button opens the **Force Reports Dialog Box (p. 2353).**

**Projected Areas**
selecting this item and clicking the **Set Up...** button opens the **Projected Surface Areas Dialog Box (p. 2355).**

**Surface Integrals**
selecting this item and clicking the **Set Up...** button opens the **Surface Integrals Dialog Box (p. 2356).**

**Volume Integrals**
selecting this item and clicking the **Set Up...** button opens the **Volume Integrals Dialog Box (p. 2359).**

**Discrete Phase**
allows you to report on one of the following three report types:

**Sample**
selecting this item and clicking the **Set Up...** button opens the **Sample Trajectories Dialog Box (p. 2362).**

**Histogram**
selecting this item and clicking the **Set Up...** button opens the **Trajectory Sample Histograms Dialog Box (p. 2363).**

**Summary**
selecting this item and clicking the **Set Up...** button opens the **Particle Summary Dialog Box (p. 2365).**

**Heat Exchanger**
selecting this item and clicking the **Set Up...** button opens the **Heat Exchanger Report Dialog Box (p. 2365).**

**Set Up...**
opens the dialog box corresponding to the selected item in the **Reports** list.

**Parameters...**
opens the **Parameters Dialog Box (p. 2367).**

For additional information, see the following sections:
35.22.1. **Flux Reports Dialog Box**
35.22.2. **Force Reports Dialog Box**
35.22.3. **Projected Surface Areas Dialog Box**
35.22.4. **Surface Integrals Dialog Box**
35.22.5. **Volume Integrals Dialog Box**
35.22.6. **Sample Trajectories Dialog Box**
35.22.7. **Trajectory Sample Histograms Dialog Box**
35.22.8. **Particle Summary Dialog Box**
35.22.9. **Heat Exchanger Report Dialog Box**
35.22.10. **Parameters Dialog Box**
35.22.11. **Use Input Parameter in Scheme Procedure Dialog Box**
35.22.1. Flux Reports Dialog Box

The **Flux Reports** dialog box allows you to compute the mass flow rate, heat transfer rate, and radiation heat transfer rate on selected boundary zones. See *Fluxes Through Boundaries (p. 1746)* for details.

![Flux Reports Dialog Box](image)

**Options**

- **Mass Flow Rate**
  - turns on the computation of the mass flow rate for the selected boundary zones.

- **Total Heat Transfer Rate**
  - turns on the computation of the total heat transfer rate for the selected boundary zones.

- **Total Sensible Heat Transfer Rate**
  - turns on the computation of the total sensible heat transfer rate for the selected boundary zones. It reports the total energy flux as defined in *Equation 5.2* in the Theory Guide.

- **Radiation Heat Transfer Rate**
  - turns on the computation of the radiation heat transfer rate for the selected boundary zones.
**Film Mass Flow Rate**
(available only when the Eulerian wall film model is enabled) turns on the computation of the mass flow rate for the selected boundary zone(s).

**Film Heat Transfer Rate**
(available only when the Eulerian wall film model is enabled) turns on the computation of the film heat transfer rate for the selected boundary zone(s).

**Boundary Types**
contains a selectable list of types of boundary zones. If you select (or deselect) an item in this list, all zones of that type will be selected (or deselected) automatically in the **Boundaries** list.

**Boundary Name Pattern**
specifies the pattern to look for in the names of boundary zones. Type the pattern in the text field and click **Match** to select (or deselect) the zones in the **Boundaries** list with names that match the specified pattern. See **Generating a Flux Report** (p. 1746) for information about matching additional characters using * and ?.

**Save Output Parameter...**
opens the **Save Output Parameter Dialog Box** (p. 2372).

**Boundaries**
contains a selectable list of valid boundary zones for flux reporting.

**Results**
displays the results of the selected flux computation for each boundary zone selected. The summation of the individual zone flux results is displayed in the box below the **Results** list.

**Compute**
computes the flux for each of the selected boundary zones and updates the **Heat of Reaction Source** and **Net Results** (for example, in kg/s, W, and so on).

**Write...**
opens the **Select File** dialog box (**The Select File Dialog Box** (p. 15) and **The Select File Dialog Box (Windows)** (p. 15)), which you can use to save the reported values to a file.

### 35.22.2. Force Reports Dialog Box

The **Force Reports** dialog box allows you to compute the forces along a specified vector, moments about a specified center, and the coordinates of the center of pressure for selected wall zones. See **Forces on Boundaries** (p. 1751) for details.
**Controls**

**Options**
contains option buttons that control computation of the forces, moments, or center of pressure.

**Forces**
enables the computation of the pressure and viscous forces.

**Moments**
enables the computation of the pressure and viscous moments.

**Center of Pressure**
enables the computation of the average location of the pressure.

**Direction Vector**
contains the components of the force vector. This label is visible when the Forces option button is active.

\[ X, Y, Z \]
are the components of the force vector along which the forces will be computed.

**Moment Center**
contains the Cartesian coordinates of the moment center. This label is visible when the Moments option button is active.

\[ X, Y, Z \]
are the Cartesian coordinates of the moment center about which moments will be computed.

**Moment Axis**
contains the Cartesian coordinates of the moment axis. This label is visible when the Moments option button is active.

\[ X, Y, Z \]
are the Cartesian coordinates of the moment axis about which moments will be computed.

**Coordinate**
contains the value of the Cartesian coordinate that is fixed. This label is visible when the Center of Pressure option button is active.
**X,Y,Z**

are the Cartesian coordinates, one of which will be fixed.

**Value (n)**

is the point where the selected Cartesian coordinate will be fixed.

**Wall Zones**

contains a selectable list of wall zones. The force or moment information is printed for each zone, and then a total force or moment for all the zones is presented.

**Wall Name Pattern**

specifies the pattern to look for in the names of wall zones. Type the pattern in the text field and click **Match** to select (or deselect) the zones in the **Wall Zones** list with names that match the specified pattern. See Generating a Force, Moment, or Center of Pressure Report (p. 1751) for information about matching additional characters using * and ?.

**Save Output Parameter...**

opens the **Save Output Parameter Dialog Box** (p. 2372).

**Print**

displays (in the console) the pressure, viscous (if appropriate), and total forces or moments, and the pressure, viscous, and total force coefficients along the specified force vector or moment center for the selected wall zones. The center of pressure coordinates will print to the console when the **Center of Pressure** option is activated.

**Write...**

opens **The Select File Dialog Box** (p. 15), which you can use to save the reported values to a file.

### 35.22.3. Projected Surface Areas Dialog Box

The **Projected Surface Areas** dialog box allows you to compute an estimated area of the projection of selected surfaces along the x, y, or z axis. See Projected Surface Area Calculations (p. 1755) for details.

**Controls**

**Projection Direction**

indicates the direction along which to project the surface.
Min Feature Size
specifies the length of the smallest feature in the geometry that you want to resolve in the area calculation.

Area
displays the computed projected area.

Surfaces
contains a list of existing surfaces. You can select the surface(s) for which the projected area is to be calculated in this list.

Compute
computes the area of the selected surfaces projected along the selected direction. The area will be printed in the Area box and in the console window.

35.22.4. Surface Integrals Dialog Box
The Surface Integrals dialog box allows you to compute the area, mass and volume flow rate, standard deviation, integral, flow rate, area-weighted average, mass-weighted average, sum, facet average, facet minimum/maximum, uniformity index (weighted by area or mass), vertex average, or vertex minimum/maximum quantity of a specified field variable on a selected list of surfaces. See Surface Integration (p. 1755) for details.
Area
  turns on the computation of the surface area.

Area-Weighted Average
  turns on the computation of the area-weighted average on the surface(s).

Facet Average
  turns on the computation of the facet-averaged quantity on the surface(s).

Facet Minimum
  turns on the computation of the facet minimum of a quantity on the surface(s).

Facet Maximum
  turns on the computation of the facet maximum of a quantity on the surface(s).

Flow Rate
  turns on the computation of the flow rate through the surface(s).

Integral
  turns on the computation of the integral on the surface(s).

Mass Flow Rate
  turns on the computation of the mass flow rate through the surface(s).

Mass-Weighted Average
  turns on the computation of the mass-averaged quantity on the surface(s).

Standard Deviation
  turns on the computation of the standard deviation of a specified field variable on a surface.

Sum
  turns on the computation of the summed quantity on the surface(s).

Uniformity Index - Mass Weighted
  turns on the computation of the mass-weighted uniformity index of a quantity on the surface(s).

Uniformity Index - Area Weighted
  turns on the computation of the area-weighted uniformity index of a quantity on the surface(s).

Vertex Average
  turns on the computation of the vertex-averaged quantity on the surface(s).

Vertex Minimum
  turns on the computation of the vertex minimum of a quantity on the surface(s).

Vertex Maximum
  turns on the computation of the vertex maximum of a quantity on the surface(s).

Volume Flow Rate
  turns on the computation of the volume flow rate through the surface(s).

Surface Types
  contains a selectable list of types of surfaces. If you select (or deselect) an item in this list, all surfaces of that type will be selected (or deselected) automatically in the Surfaces list.
Surface Name Pattern specifies the pattern to look for in the names of surfaces. Type the pattern in the text field and click Match to select (or deselect) the zones in the Surfaces list with names that match the specified pattern. See Generating a Surface Integral Report (p. 1756) for information about matching additional characters using * and ?.

Field Variable contains a list of the field variables that can be used in the surface integrations. This option is not active if the Area, Mass Flow Rate, or Volume Flow Rate option is active.

Surfaces is a selectable list of surfaces.

Area displays the result of the area summation over all the selected surfaces. This label is visible when Area is active.

Area-Weighted Average displays the result of the area-weighted average computation over all the selected surfaces. This label is visible when Area-Weighted Average is active.

Average of Facet Values displays the result of the facet-averaged computation over all the selected surfaces. This label is visible when Facet Average is active.

Minimum of Facet Values displays the minimum facet value on all the selected surfaces. This label is visible when Facet Minimum is active.

Maximum of Facet Values displays the maximum facet value on all the selected surfaces. This label is visible when Facet Maximum is active.

Flow Rate displays the result of the flow rate computation over all the selected surfaces. This label is visible when Flow Rate is active.

Integral displays the result of the integral computation over all the selected surfaces. This label is visible when Integral is active.

Mass Flow Rate displays the result of the mass flow rate computation over all the selected surfaces. This label is visible when Mass Flow Rate is active.

Mass-Weighted Average displays the result of the mass-averaged computation over all the selected surfaces. This label is visible when Mass-Weighted Average is active.

Standard Deviation displays the result of the standard deviation computation over all the selected surfaces. This label is visible when Standard Deviation is active.
Sum of Facet Values
displays the result of the summation over all the selected surfaces. This label is visible when Sum is active.

Uniformity Index Mass-Wt.
displays the mass-weighted uniformity index value on all the selected surfaces. This label is visible when Uniformity Index - Mass Weighted is active.

Uniformity Index Area-Wt.
displays the area-weighted uniformity index value on all the selected surfaces. This label is visible when Uniformity Index - Area Weighted is active.

Average of Surface Vertex Values
displays the result of the vertex-averaged computation over all the selected surfaces. This label is visible when Vertex Average is active.

Minimum of Vertex Values
displays the minimum facet value on all the selected surfaces. This label is visible when Vertex Minimum is active.

Maximum of Vertex Values
displays the maximum facet value on all the selected surfaces. This label is visible when Vertex Maximum is active.

Volumetric Flow Rate
displays the result of the volumetric flow rate computation over all the selected surfaces. This label is visible when Volume Flow Rate is active.

Highlight Surfaces
when enabled highlights the surfaces (selected in the Surface Integrals dialog box) in the graphics window.

Save Output Parameter...
opens the Save Output Parameter Dialog Box (p. 2372).

Compute
computes the specified integration on the selected surfaces.

Write...
opens The Select File Dialog Box (p. 15), which you can use to save the reported values to a file.

35.22.5. Volume Integrals Dialog Box

The Volume Integrals dialog box allows you to compute the volume, sum, maximum, minimum, volume integral, volume-averaged quantity, mass integral, or mass-averaged quantity of a specified field variable on a selected list of cell zones. See Volume Integration (p. 1758) for details.
Controls

Report Type
contains option buttons that control the method of volume integration.

**Mass-Average**
turns on the computation of the mass-averaged quantity on the cell zone.

**Mass Integral**
turns on the computation of the mass integral on the cell zone.

**Mass**
turns on the computation of the total mass in the cell zone for the selected phase.

**Sum**
turns on the computation of the summation over all cells in the selected zone.

**Sum*2Pi**
computes the summation over all cells in the selected zone of a 2D axisymmetric model and multiplies the result by \(2\pi\) to give the summation over the revolved domain. This option is only available in 2D axisymmetric cases.

**Minimum**
computes the minimum value of the selected variable at each cell in the selected zone.

**Maximum**
computes the maximum value of the selected variable at each cell in the selected zone.

**Volume**
turns on the computation of the cell zone volume.

**Volume Integral**
turns on the computation of the volume integral on the cell zone.

**Volume-Average**
turns on the computation of the volume-weighted average on the cell zone.
Field Variable contains a list of the field variables that can be used in the sum, volume integral, and average computations. This option is not active if the Volume option is active.

Cell Zones is a selectable list of cell zones.

Total Volume displays the result of the volume computation over all the selected zones. This label is visible when Volume is active.

Sum displays the result of the summation over all the selected zones. This label is visible when Sum is active.

Sum *2Pi displays the result of the summation over all the selected zones multiplied by 2\pi. This label is visible when Sum*2Pi is active.

Max displays the result of the maximum value of the selected zone(s). This label is visible when Maximum is active.

Min displays the result of the minimum value of the selected zone(s). This label is visible when Minimum is active.

Total Volume Integral displays the result of the volume-integral computation over all the selected zones. This label is visible when Volume Integral is active.

Volume-Weighted Average displays the result of the volume-averaged computation over all the selected zones. This label is visible when Volume-Average is active.

Total Mass-Weighted Integral displays the result of the mass-integral computation over all the selected zones. This label is visible when Mass Integral is active.

Mass-Weighted Average displays the result of the mass-averaged computation over all the selected zones. This label is visible when Mass-Average is active.

Save Output Parameter... opens the Save Output Parameter Dialog Box (p. 2372).

Compute computes the specified integration on the selected zones.

Write... opens The Select File Dialog Box (p. 15), which you can use to save the reported values to a file.
35.22.6. Sample Trajectories Dialog Box

The **Sample Trajectories** dialog box allows the writing of particle states (position, velocity, diameter, temperature, and mass flow rate) at various boundaries and planes (lines in 2D). See **Sampling of Trajectories** (p. 1234) for details about the items below.

### Controls

**Boundaries**
- lists boundaries that can be chosen as the surfaces at which samples will be written.

**Lines**
- (in 2D) lists lines that can be chosen as the surfaces at which samples will be written.

**Planes**
- (in 3D) lists planes that can be chosen as the surfaces at which samples will be written.

**Release From Injections**
- lists injections from which the injection to be tracked is chosen.

**Append Files**
- causes the results of multiple calculations to be appended to a single file.

**Accumulate Erosion/Accretion Rates**
- causes erosion and accretion rates to be accumulated for repeated trajectory calculations.

**User-Defined Functions**
- allow control of the format and the information written for the sample output.

**Output**
- contains a drop-down list of available user-defined functions.
**Compute**
causes the particles to be tracked and their status to be written to files when they encounter selected surfaces. This button will not appear for unsteady particle tracking.

**Start**
initiates sampling for unsteady particle tracking. This button will replace the **Compute** button if you are performing unsteady particle tracking. After you click it, it will change to the **Stop** button. Click **Stop** to stop the sampling. (The label will change back to **Start**.)

### 35.22.7. Trajectory Sample Histograms Dialog Box

The **Trajectory Sample Histograms** dialog box allows the plotting of histograms from sample files created in the **Sample Trajectories Dialog Box** (p. 2362). See **Histogram Reporting of Samples** (p. 1236) for details about the items below.

![Trajectory Sample Histograms Dialog Box](image)

**Controls**

**Options**
contains check buttons for histogram options.

- **Auto Range**
toggles between automatic and manual settings of the histogram range.

- **Percent**
causes the plot to indicate the percent of particles. Deselecting this will result in the actual number of particles being plotted.

- **Histogram Mode**
allows you to display the histogram with or without bars.

- **Weighting**
allows you to apply a weight to the data sample.
**Diameter Statistics**
allows you to display a summary of diameter statistics for a selected variable in the console window.

**Correlation**
allows you to choose correlations between how one particle variable depends on another particle variable.

**Cumulative Curve**
allows you to compute a cumulative distribution curve for a selected variable.

**Variable^3**
allows you to plot the cumulative mass distribution for a constant particle density using the particle diameter.

**Divisions**
sets the number of “bins” in the histogram.

**Sample**
lists the data samples that have been read in.

**Variable**
lists the fields variables available in the selected sample.

**Weight**
lists the weighted fields variables available in the selected sample.

**Correlation**
lists the sampled variables, allowing you to choose the correlation variable.

**Min**
displays the minimum value of the variable selected in the Variable list. If Auto Range is off, you can set the minimum by typing a new value.

**Max**
displays the maximum value of the variable selected in the Fields list. If Auto Range is off, you can set the maximum by typing a new value.

**Axes...**
opens the Axes Dialog Box (p. 2347), which allows you to customize the histogram axes.

**Curves...**
opens the Curves Dialog Box (p. 2349), which allows you to customize the curves used in the histogram.

**Plot**
displays the histogram in the active graphics window.

**Write...**
allows you store the histograms in an XY-plot file format

**Compute**
updates the Min and Max values.

**Read...**
opens The Select File Dialog Box (p. 15), where you can select a sample file to be read.
Delete
removes the sample selected in the Sample list.

**35.22.8. Particle Summary Dialog Box**

The Particle Summary dialog box allows you to report a summary for particle injections. See Summary Reporting of Current Particles (p. 1237) for details about the items below.

**Controls**

**Injections**
lists the particle injection(s) for which you can generate a summary.

**Injection Name Pattern**
specifies the pattern to look for in the names of injections. Type the pattern in the text field and click Match to select (or deselect) the injection in the Injections list with names that match the specified pattern. See Summary Reporting of Current Particles (p. 1237) for information about matching additional characters using * and ?.

**Summary**
prints the injection summary in the console window.

**35.22.9. Heat Exchanger Report Dialog Box**

The Heat Exchanger Report dialog box allows you to report a summary for heat exchangers. See Postprocessing for the Heat Exchanger Model (p. 878) for details about the items below.
Controls

Options
lists the available reporting options for the heat exchanger.

Computed Heat Rejection
allows you to report the heat rejection calculated from the heat exchanger.

Inlet Temperature
allows you to report the inlet temperature for both the primary and the auxiliary heat exchanger fluid.

Outlet Temperature
allows you to report the outlet temperature for both the primary and the auxiliary heat exchanger fluid.

Mass Flow Rate
allows you to report the mass flow rate for both the primary and the auxiliary heat exchanger fluid.

Specific Heat
allows you to report the specific heat for both the primary and the auxiliary heat exchanger fluid.

Result
displays the results of the calculations once the Compute button is selected.

Heat Exchanger
displays a list of heat exchanger fluid zones

Fluid Zone
(not available when Computed Heat Rejection option is selected.) allows you to report quantities for either the primary or auxiliary fluid zones.

Compute
computes the specified quantity on the selected zones.

Write...
opens The Select File Dialog Box (p. 15), which you can use to save the reported values to a file.
35.22.10. Parameters Dialog Box

The Parameters dialog box allows you to create input parameters (in Scheme or UDF procedures only) and output parameters, which allow you to compare reporting values for different cases, or include reporting values in the function minimized by the mesh morpher/optimizer. See Creating Output Parameters (p. 1743) for details about the items below.

![Parameters dialog box]

Controls

Input Parameters
- contains a list of existing input parameters. See Defining and Viewing Parameters (p. 206) for details about creating input parameters.

Edit...
- opens the Input Parameter Properties Dialog Box (p. 2372).

Important

When using ANSYS Fluent in ANSYS Workbench, parameters are not editable, so the Edit... button becomes the View... button. This opens the Input Parameter Properties Dialog Box (p. 2372) where the parameter properties can only be viewed. For more information, see the separate ANSYS Fluent in Workbench User’s Guide.

Delete
- removes the selected input parameter from the list of Input Parameters.

More
- contains a drop-down list that allows more advanced use of input parameters. Available options include:

  Use in Scheme Procedure
  - opens the Use Input Parameter in Scheme Procedure Dialog Box (p. 2369).
Use in UDF
opens the Use Input Parameter in UDF Dialog Box (p. 2370).

Output Parameters
contains a list of existing output parameters.

Create
contains a drop-down list that allows you to create additional output parameters. Available options include:

Fluxes
opens the Flux Reports Dialog Box (p. 2352).

Forces
opens the Force Reports Dialog Box (p. 2353).

Surface Integrals
opens the Surface Integrals Dialog Box (p. 2356).

Volume Integrals
opens the Volume Integrals Dialog Box (p. 2359).

Drag
opens the Drag Monitor Dialog Box (p. 2226).

Lift
opens the Lift Monitor Dialog Box (p. 2229).

Moments
opens the Moment Monitor Dialog Box (p. 2231).

User Defined
opens the User Defined Output Parameter Dialog Box (p. 2370).

Edit...
opens the dialog box corresponding to the selected item in the Output Parameters list.

More
contains a drop-down list containing additional tasks that you can perform, including:

Delete
removes the selected output parameter from the list of Output Parameters.

Rename
allows you to edit the name of the output parameter through the Rename Dialog Box (p. 2371).

Print to Console
reports values to the console window. If you select multiple output parameters, then the output includes values from multiple output parameters.

Print All to Console
outputs the values from all output parameters to the console window.

Write...
allows you to store the output to a file. A dialog box is displayed allowing you to provide a file name.
Write All...
prompts you for a file name and then writes the values for all of the output parameters to a file.

Note
ANSYS Fluent automatically creates generic default names for new input and output parameters (for example, parameter-1, parameter-2, parameter-3, and so on) if a parameter is deleted, the default name is not reused. For example, if you have parameter-1, parameter-2, and parameter-3, then delete parameter-2 and create a new parameter, the default name for the new parameter will be parameter-4.

35.22.11. Use Input Parameter in Scheme Procedure Dialog Box

The Use Input Parameter in Scheme Procedure dialog box allows you to use the input parameter in a Scheme procedure. In turn, this Scheme procedure can also use text user interface (TUI) commands. For more information, see Working With Advanced Parameter Options (p. 210).

Controls

Input Parameter
contains the name of an input parameter.

Select
opens the Select Input Parameter Dialog Box (p. 2097) where an input parameter can be chosen.

Scheme Procedure (Single Real Argument)
contains a procedure name (if already defined using a Scheme file) or procedure body written in the Scheme language using lambda. This procedure should receive one real argument.

Define
registers the selected input parameter.

Registered List
contains a list of registered input parameters.
Delete
removes a selected registered input parameter from the list.

Print
prints details of the registered input parameters.

35.22.12. Use Input Parameter in UDF Dialog Box

The **Use Input Parameter in UDF** dialog box allows you to select the input parameters that can be used inside a user-defined function (UDF) during calculations.

Controls

**Input Parameter**
contains the name of an input parameter.

**Select**
opens the **Select Input Parameter Dialog Box** (p. 2097) where an input parameter can be chosen.

**Define**
registers the selected input parameter.

**Registered List**
contains a list of registered input parameters.

**Delete**
removes a selected registered input parameter from the list.

**Print**
prints the ID of the registered input parameters. The ID values are used to access the value of the parameter in the UDF.

35.22.13. User Defined Output Parameter Dialog Box

The **User Defined Output Parameter** dialog box allows you to define an output parameter using a user-defined function (UDF). The UDF should be written using the **DEFINE_OUTPUT_PARAMETER** macro (see the **UDF Manual**). You can pass values of selected input parameters to this UDF as arguments. For more information, see **Computing Output Parameters With User-Defined Functions** (p. 1745).
Controls

**UDF for Output Parameter**
contains a drop-down list of available user-defined functions.

**Input Parameters Passed to UDF**
contains a list of available input parameters.

**New Parameter**
opens the Input Parameter Properties Dialog Box (p. 2372) where you can set new parameters and their properties.

### 35.22.14. Rename Dialog Box

The **Rename** dialog box allows you to change the name of the output parameter that you created.

**Controls**

**New Name**
contains the new name of the output parameter.
35.22.15. Input Parameter Properties Dialog Box

The *Input Parameter Properties* dialog box allows you to create input parameters, which allow you to compare reporting values for different cases. See *Creating Output Parameters* (p. 1743) for details about the items below.

![Input Parameter Properties Dialog Box](image)

**Controls**

**Name**
contains the name of the input parameter.

**Current Value**
contains the current value of the input parameter.

**Used In**
indicates the cell zone or boundary condition where the input parameter is currently used.

---

**Note**

ANSYS Fluent automatically creates generic default names for new input and output parameters (for example, parameter-1, parameter-2, parameter-3, and so on) if a parameter is deleted, the default name is not reused. For example, if you have parameter-1, parameter-2, and parameter-3, then delete parameter-2 and create a new parameter, the default name for the new parameter will be parameter-4.

---

35.22.16. Save Output Parameter Dialog Box

The *Save Output Parameter* dialog box allows you to save specific output parameters which allow you to compare reporting values for different cases. See *Creating Output Parameters* (p. 1743) for details about the items below.
Controls

Options
contains options for saving your output parameters.

Create New Output Parameter
allows you to create a new output parameter.

Apply Report Settings to an Existing Output Parameter
allows you to overwrite an existing output parameter of the same type.

Name
contains the name for the current output parameter.

Note
ANSYS Fluent automatically creates generic default names for new input and output parameters (for example, parameter-1, parameter-2, parameter-3, and so on). If a parameter is deleted, the default name is not reused. For example, if you have parameter-1, parameter-2, and parameter-3, then delete parameter-2 and create a new parameter, the default name for the new parameter will be parameter-4.
Chapter 36: Menu Reference Guide

This reference guide provides information about the menus in Fluent

36.1. File Menu
36.2. Mesh Menu
36.3. Define Menu
36.4. Solve Menu
36.5. Adapt Menu
36.6. Surface Menu
36.7. Display Menu
36.8. Report Menu
36.9. Parallel Menu
36.10. View Menu
36.11. Turbo Menu
36.12. Help Menu

36.1. File Menu

For additional information, see the following sections:

36.1.1. File/Read/Mesh...
36.1.2. File/Read/Case...
36.1.3. File/Read/Data...
36.1.4. File/Read/Case & Data...
36.1.5. File/Read/PDF...
36.1.6. File/Read/ISAT Table...
36.1.7. File/Read/DTRM Rays...
36.1.8. File/Read/View Factors...
36.1.9. File/Read/Profile...
36.1.10. File/Read/Scheme...
36.1.11. File/Read/Journal...
36.1.12. File/Write/Case...
36.1.13. File/Write/Data...
36.1.14. File/Write/Case & Data...
36.1.15. File/Write/PDF...
36.1.16. File/Write/ISAT Table...
36.1.17. File/Write/Flamelet...
36.1.18. File/Write/Surface Clusters...
36.1.19. File/Write/Profile...
36.1.20. File/Write/Autosave...
36.1.21. File/Write/Boundary Mesh...
36.1.22. File/Write/Start Journal...
36.1.23. File/Write/Stop Journal
36.1.24. File/Write/Start Transcript...
36.1.25. File/Write/Stop Transcript
36.1.26. File/Import/ABAQUS/Input File...
36.1.27. File/Import/ABAQUS/Filbin File...
36.1.28. File/Import/ABAQUS/ODB File...
36.1.1. File/Read/Mesh...

The File/Read/Mesh... menu item opens the Read Mesh Options Dialog Box (p. 2376) which allows you to read or replace a mesh.

36.1.1.1. Read Mesh Options Dialog Box

The Read Mesh Options dialog box is used to read or replace a mesh. See Reading Mesh Files (p. 46) for more information.
Controls

Options
allows you to read in a new mesh or replace the existing mesh.

Discard Case And Data, Read New Mesh
results in both the case and data files being discarded when reading in a new mesh.

Discard Data, Replace Mesh
results in the data file being discarded when replacing an existing mesh.

Show Scale Mesh Panel After Replacing Mesh
gives you the option to have the Scale Mesh Dialog Box (p. 1890) appear automatically for you to check or scale your mesh.

36.1.2. File/Read/Case...
The File/Read/Case... menu item is used to read in an ANSYS Fluent case file (extension .cas), or a mesh file (extension .msh, .grd, .MSH, or .GRD) that has been saved in the native format for ANSYS Fluent. See Reading Mesh Files (p. 46) and Reading and Writing Case and Data Files (p. 47) for details.

The File/Read/Case... menu item opens The Select File Dialog Box (p. 15) which allows you to select the appropriate file to be read.
36.1.3. File/Read/Data...

The File/Read/Data... menu item is used to read in an ANSYS Fluent data file (which has a .dat extension) or parallel data file (which has a .pdat extension). This menu item will not be available until you read in a case or mesh file. See Reading and Writing Data Files (p. 48) and Reading and Writing Parallel Data Files (p. 52) for details.

The File/Read/Data... menu item opens The Select File Dialog Box (p. 15) which allows you to select the appropriate file to be read.

36.1.4. File/Read/Case & Data...

The File/Read/Case & Data... menu item is used to read in an ANSYS Fluent case file and the corresponding data file (for example, myfile.cas and myfile.dat) together. See Reading and Writing Case and Data Files Together (p. 49) for details.

The File/Read/Case & Data... menu item opens The Select File Dialog Box (p. 15) which allows you to select the appropriate files to be read. Select the appropriate case file, and the corresponding data file (that is, the file having the same name with a .dat extension) will also be read in.

36.1.5. File/Read/PDF...

The File/Read/PDF... menu item is used to read a PDF file (extension .pdf) created by ANSYS Fluent for use with the non-premixed or partially premixed combustion model. This menu item is available only when the non-premixed or partially premixed combustion model has been enabled. See Saving the Look-Up Tables (p. 983) for details.
36.1.6. File/Read/ISAT Table...

The File/Read/ISAT Table... menu item is used to read an ISAT table (extension .isat) for use with the Composition PDF Transport model. This menu item is available only when the Composition PDF Transport model has been enabled. See Using ISAT Efficiently (p. 1042) for details.

36.1.7. File/Read/DTRM Rays...

The File/Read/DTRM Rays... menu item is used to read a ray file (extension .ray) created by ANSYS Fluent for use with the DTRM (radiation model). This menu item is available only when the DTRM has been enabled. See Writing and Reading the DTRM Ray File (p. 781) for details.

36.1.8. File/Read/View Factors...

The File/Read/View Factors... menu item is used to read in a view factor file for use with the surface-to-surface (S2S) radiation model. This menu item is available only when the S2S model has been enabled. See Reading View Factors into ANSYS Fluent (p. 794) for details.

36.1.9. File/Read/Profile...

The File/Read/Profile... menu item opens the Select File dialog box for reading profiles (Reading Profile Files (p. 54)), It is used to read a cell zone or boundary condition profile file (extension .prof). A profile file defines profiles that can be used to specify flow conditions for a cell zone or a boundary. See Profiles (p. 377) for details.

36.1.10. File/Read/Scheme...

The File/Read/Scheme... menu item is used to read in a Scheme source file (extension .scm). See Reading Scheme Source Files (p. 57) for details.

36.1.11. File/Read/Journal...

The File/Read/Journal... menu item is used to read in a journal file (extension .jou) containing a sequence of ANSYS Fluent commands. You can create a journal file using the File/Write/Journal... menu item. See Creating and Reading Journal Files (p. 57) for details.

36.1.12. File/Write/Case...

The File/Write/Case... menu item is used to save an ANSYS Fluent case file. See Reading and Writing Case Files (p. 48) for details.

The File/Write/Case... menu item opens The Select File Dialog Box (p. 15) which allows you to save the file with a name of choice. The dialog box is similar to the Select File dialog box for reading files, except that it has an additional option for writing binary files.

**Important**

- When ANSYS Fluent writes a case file, the .cas extension is added to the file name specified, unless the name already ends with .cas.
36.1.13. File/Write/Data...

The File/Write/Data... menu item is used to save an ANSYS Fluent data file (which has a .dat extension) or parallel data file (which has a .pdat extension). See Reading and Writing Data Files (p. 48) and Reading and Writing Parallel Data Files (p. 52) for details.

Important

- When ANSYS Fluent writes a data file, the .dat extension is added to the file name specified, unless the name already ends with .dat or .pdat.

- You can compress data files by appending .gz or .Z to the file name (see Reading and Writing Compressed Files (p. 43) for details about file compression). To compress parallel data files (that is, files saved with a .pdat extension), you must use asynchronous file compression (see Reading and Writing Case and Data Files (p. 47)).

36.1.14. File/Write/Case & Data...

The File/Write/Case & Data... menu item is used to save an ANSYS Fluent case file and data file at the same time (for example, myfile.cas and myfile.dat). See Reading and Writing Case and Data Files Together (p. 49) for details.

Enter the name of the case file in the text entry box in the Select File dialog box and the corresponding data file (same file name, but with a .dat extension) will also be written.

36.1.15. File/Write/PDF...

The File/Write/PDF... menu item is used to write a PDF file after computing the look-up tables using the non-premixed or partially premixed combustion model in ANSYS Fluent. This menu item is available only when the non-premixed or partially premixed combustion model has been enabled. See Saving the Look-Up Tables (p. 983) for details.

36.1.16. File/Write/ISAT Table...

The File/Write/ISAT Table... menu item is used to write an ISAT table. See Using ISAT Efficiently (p. 1042) for details.

36.1.17. File/Write/Flamelet...

The File/Write/Flamelet... menu item is used to write a flamelet file generated using the non-premixed or partially premixed combustion model in ANSYS Fluent. This menu item is available only when the non-premixed or partially premixed combustion model has been enabled. See The Diffusion Flamelet Models Theory in the Theory Guide for details.
36.1.18. File/Write/Surface Clusters...

The File/Write/Surface Clusters... menu item is used to set parameters related to surface clusters and view factors for the surface-to-surface radiation model. It opens the View Factors and Clustering Dialog Box (p. 1921). The dialog box that you open using the File/Write/Surface Clusters... menu item is different than the one opened via the Settings... button in the Radiation Model dialog box, in that it saves the settings you specify to a file, which can be used to calculate the view factors outside of ANSYS Fluent (see Computing View Factors Outside ANSYS Fluent (p. 793)). When you click OK, the The Select File Dialog Box (p. 15) will open so that you can specify a name for the file where ANSYS Fluent should save the settings.

36.1.19. File/Write/Profile...

The File/Write/Profile... menu item opens the Write Profile Dialog Box (p. 2101).

36.1.20. File/Write/Autosave...

The File/Write/Autosave... menu item opens the Autosave Dialog Box (p. 2256).

36.1.21. File/Write/Boundary Mesh...

The File/Write/Boundary Mesh... menu item is used to write the boundary zones (surface mesh) of the domain to a file. You can then read this file into the meshing mode of Fluent or GAMBIT to produce an improved volume mesh. See Writing a Boundary Mesh (p. 57) for details.

36.1.22. File/Write/Start Journal...

The File/Write/Start Journal... menu item is used to start the recording of subsequent ANSYS Fluent commands to a journal file. You can read this journal file back into Fluent later (using the File/Read/Journal... menu item) to automate the execution of the recorded commands. See Creating and Reading Journal Files (p. 57) for details.

36.1.23. File/Write/Stop Journal

The File/Write/Stop Journal menu item replaces the File/Write/Start Journal... menu item after the recording of a journal file has begun. The File/Write/Stop Journal menu item is used to end the journal recording. See Creating and Reading Journal Files (p. 57) for details.

36.1.24. File/Write/Start Transcript...

The File/Write/Start Transcript... menu item is used to start the recording of a transcript file containing all input to and output from Fluent. (You cannot read a transcript file back into Fluent.) See Creating Transcript Files (p. 59) for details.

36.1.25. File/Write/Stop Transcript

The File/Write/Stop Transcript menu item replaces the File/Write/Start Transcript... menu item after the recording of a transcript file has begun. The File/Write/Stop Transcript menu item is used to end the transcript recording. See Creating Transcript Files (p. 59) for details.
36.1.26. File/Import/ABAQUS/Input File...

The File/Import/ABAQUS/Input File... menu item is used to import an ABAQUS input file (extension .inp) which contains the input description of a finite element model for the ABAQUS finite element program. See ABAQUS Files (p. 62) for details.

36.1.27. File/Import/ABAQUS/Filbin File...

The File/Import/ABAQUS/Filbin File... menu item is used to import an ABAQUS filbin file (extension .fil) which contains the finite element model and results data. See ABAQUS Files (p. 62) for details.

36.1.28. File/Import/ABAQUS/ODB File...

The File/Import/ABAQUS/ODB File... menu item is used to import an ABAQUS ODB file with a .odb extension. See ABAQUS Files (p. 62) for details.

36.1.29. File/Import/CFX/Definition File...

The File/Import/CFX/Definition File... menu item is used to import a CFX definition file (extension .def) which contains mesh information to be read into Fluent. See CFX Files (p. 62) for details.

36.1.30. File/Import/CFX/Result File...

The File/Import/CFX/Result File... menu item is used to import a CFX result file (extension .res). See CFX Files (p. 62) for details.

36.1.31. File/Import/CGNS/Mesh...

The File/Import/CGNS/Mesh... menu item is used to read in a CGNS-format mesh file (extension .cgns). See Meshes and Data in CGNS Format (p. 63) for details.

36.1.32. File/Import/CGNS/Data...

The File/Import/CGNS/Data... menu item is used to read in a CGNS-format data file. See Meshes and Data in CGNS Format (p. 63) for details.

36.1.33. File/Import/CGNS/Mesh & Data...

The File/Import/CGNS/Mesh & Data... menu item is used to read in a set of CGNS-format mesh and data files. See Meshes and Data in CGNS Format (p. 63) for details.

36.1.34. File/Import/EnSight...

The File/Import/EnSight... menu item is used to import EnSight files (extension .encas or .case). See EnSight Files (p. 64) for details.

36.1.35. File/Import/FIDAP...

The File/Import/FIDAP... menu item is used to import an ANSYS FIDAP neutral file (extension .FDNEUT or .unv). See ANSYS FIDAP Neutral Files (p. 64) for details.
36.1.36. File/Import/GAMBIT...

The File/Import/GAMBIT... menu item is used to read in a neutral file from GAMBIT. See GAMBIT and GeoMesh Mesh Files (p. 64) for details.

36.1.37. File/Import/HYPERMESH ASCII...

The File/Import/HYPERMESH ASCII... menu item is used to import a HYPERMESH ASCII file (extension .hm, .hma, or .hmasci). See HYPERMESH ASCII Files (p. 64) for details.

36.1.38. File/Import/I-deas Universal...

The File/Import/I-deas Universal... menu item is used to import an I-deas Universal file which contains mesh information and zone types to be read into Fluent. See I-deas Universal Files (p. 65) for details.

36.1.39. File/Import/LSTC/Input File...

The File/Import/LSTC/Input File... menu item is used to import an LSTC input file (extension .k, .key, or .dyn) which contains the input description of a finite element model for the LS-DYNA finite element program. See LSTC Files (p. 65) for details.

36.1.40. File/Import/LSTC/State File...

The File/Import/LSTC/State File... menu item is used to import an LSTC state file (extension .d3plot) which contains control data, geometry data, and state data. See LSTC Files (p. 65) for details.

36.1.41. File/Import/Marc POST...

The File/Import/Marc POST... menu item is used to import a Marc POST file generated using the MSC Marc finite element program. See Marc POST Files (p. 65) for details.

36.1.42. File/Import/Mechanical APDL/Input File...

The File/Import/Mechanical APDL/Input File... menu item is used to import a Mechanical APDL input file (extensions .ans, .neu, .cdb, or .prep7) which contains mesh information to be read into Fluent. See Mechanical APDL Files (p. 66) for details.

36.1.43. File/Import/Mechanical APDL/Result File...

The File/Import/Mechanical APDL/Result File... menu item is used to import a Mechanical APDL result file (extension .rfl, .rst, .rth, or .rmg). See Mechanical APDL Files (p. 66) for details.

36.1.44. File/Import/NASTRAN/Bulkdata File...

The File/Import/NASTRAN/Bulkdata File... menu item is used to import a NASTRAN Bulkdata file (extension .nas, .dat, or .bdf) which contains mesh information to be read into Fluent. See NAS-TRAN Files (p. 66) for details.
36.1.45. File/Import/NASTRAN/Op2 File...

The File/Import/NASTRAN/Op2 File... menu item is used to import a NASTRAN Op2 file (extension .op2) which is an output binary data file containing data used in the NASTRAN finite element program. See NASTRAN Files (p. 66) for details.

36.1.46. File/Import/PATRAN/Neutral File...

The File/Import/PATRAN/Neutral File... menu item is used to read in a PATRAN Neutral file (extension .neu, .out, or .pat) zoned by named components (that is, with the nodes placed into zones based on group name). The PATRAN neutral file contains mesh information to be read into Fluent. See PATRAN Neutral Files (p. 66) for details.

36.1.47. File/Import/PLOT3D/Grid File...

The File/Import/PLOT3D/Grid File... menu item is used to import a PLOT3D grid file (extension .g, .x, .xyz, or .grd). See PLOT3D Files (p. 66) for details.

36.1.48. File/Import/PLOT3D/Result File...

The File/Import/PLOT3D/Result File... menu item is used to import a PLOT3D result file (extension .g, .x, .xyz, or .grd). See PLOT3D Files (p. 66) for details.

36.1.49. File/Import/PTC Mechanica Design...

The File/Import/PTC Mechanica Design... menu item is used to import a PTC Mechanica Design file (extension .neu) which contains analysis, model, and results data (only in binary form). See PTC Mechanica Design Files (p. 67) for details.

36.1.50. File/Import/Tecplot...

The File/Import/Tecplot... menu item is used to read in a Tecplot binary file. See Tecplot Files (p. 67) for details.

36.1.51. File/Import/Fluent 4 Case File...

The File/Import/Fluent 4 Case File... menu item is used to read in a case file created in FLUENT 4. See Fluent 4 Case Files (p. 67) for details.

36.1.52. File/Import/PreBFC File...

The File/Import/PreBFC File... menu item is used to read in a structured (quadrilateral or hexahedral) mesh that was created using PreBFC. See PreBFC Files (p. 68) for details.

36.1.53. File/Import/Partition/Metis...

The File/Import/Partition/Metis... menu item is used to partition a mesh and then read it into the parallel version of ANSYS Fluent. See Using the Partition Filter (p. 1874) for an explanation of the difference between this menu item and the File/Import/Partition/Metis Zone... menu item.
36.1.54. File/Import/Partition/Metis Zone...

The File/Import/Partition/Metis Zone... menu item is used to partition each cell zone in a mesh individually and then read the mesh into the parallel version of ANSYS Fluent. See Using the Partition Filter (p. 1874) for an explanation of the difference between this menu item and the File/Import/Partition/Metis... menu item.

36.1.55. File/Import/CHEMKIN Mechanism...

The File/Import/CHEMKIN Mechanism... menu item opens the CHEMKIN Mechanism Import Dialog Box (p. 2385).

36.1.55.1. CHEMKIN Mechanism Import Dialog Box

The CHEMKIN Mechanism Import dialog box is used to import a CHEMKIN-format chemical mechanism file into ANSYS Fluent. See Importing a Volumetric Kinetic Mechanism in CHEMKIN Format (p. 915) for details.

![CHEMKIN Mechanism Import Dialog Box]

- **Material Name**
  - Specifies a name for the material.

**Controls**

- **Material Name**
  - Specifies a name for the material.
Gas-Phase CHEMKIN
contains inputs for importing the gas-phase CHEMKIN mechanism.

Gas-Phase CHEMKIN Mechanism File
specifies the name of the gas-phase CHEMKIN-format file. If the file is not in the current working folder, include the full path to the folder where it is located.

Gas-Phase Thermodynamic Database File
specifies the location of the gas-phase thermodynamic database file.

Import Surface CHEMKIN Mechanism
enables the importing of the surface CHEMKIN mechanism.

Surface CHEMKIN
contains inputs for importing the surface CHEMKIN mechanism. This option is available only when the Import Surface CHEMKIN Mechanism option is enabled.

Surface CHEMKIN Mechanism File
specifies the name of the surface CHEMKIN-format file.

Surface Thermodynamic Database File
specifies the location of the surface thermodynamic database file.

Import Transport Property Database
enables the importing of the CHEMKIN transport database.

CHEMKIN Transport Database
contains the input for importing the Transport Property Database File. This option is available only when the Import Transport Property Database option is enabled.

Transport Property Database File
specifies the name of the transport property database file.

36.1.56. File/Export/Solution Data...

The File/Export/Solution Data... menu item opens the Export Dialog Box (p. 2386).

36.1.56.1. Export Dialog Box

The Export dialog box allows you to write data that can be read by other data visualization and post-processing tools. See Exporting Solution Data (p. 68) for a complete description of the available data formats and how to use the dialog box.
Controls

File Type contains a drop-down list that controls the output file format that will be written using the **Write...** button.

- **ABAQUS** allows you to specify the surface(s) and optional loads, based on the kind of finite element analysis selected, to be exported to an ABAQUS file (extension `.inp`).

- **ASCII** allows you to specify the surface(s), scalars, location in the cell from which the values of scalar functions are to be taken, and the delimiter separating the fields, to be exported to an ASCII file.

- **AVS** allows you to specify the scalars you want to write to be exported to an AVS file.

- **CFD-Post Compatible** allows you to specify the scalars you want to write, the cell zones from which the values of scalar functions are to be taken, the file format, and whether a case file is written, as part of the exporting of files that are compatible with the CFD-Post application (that is, `.cdat` and `.cst` files).

- **CGNS** allows you to specify the scalars you want to write and the location from which the values of scalar functions are to be taken, to be exported to a CGNS file (extension `.cgns`).

- **Data Explorer** allows you to specify the surface(s) and the scalars you want to write to be exported to a Data Explorer file (extension `.dx`).
EnSight Case Gold
allows you to specify the scalars you want to write, the cell zones, interior zone surfaces, and location in the cell from which the values of scalar functions are to be taken, and the file format, to be exported to an EnSight file (extension .geo, .vel, .scl1, or .encas).

FAST
allows you to specify the scalars you want to write, to be exported as a grid file (Plot3D format), a velocity file, and a scalar file. This option is available only for a triangular or tetrahedral mesh.

FAST Solution
allows you to export a single file containing density, velocity, and total energy data. This option is available only for a triangular or tetrahedral mesh.

Fieldview Unstructured
allows you to specify the scalars you want to write and the cell zones from which the values of scalar functions are to be taken, to be exported to a FIELDVIEW binary file (extension .fvuns) and a regions file (extension .fvuns.fvreg).

I-deas Universal
allows you to specify the surface(s), scalars, and optional loads, based on the kind of finite element analysis selected, to be exported to an I-deas Universal file.

Mechanical APDL Input
allows you to specify the surface(s) and optional loads, based on the kind of finite element analysis selected, to be exported to a Mechanical APDL Input file (extension .cdb).

NASTRAN
allows you to specify the surface(s), scalars, and optional loads, based on the kind of finite element analysis selected, to be exported to a NASTRAN file (extension .bdf).

PATRAN
allows you to specify the surface(s), scalars, and optional loads, based on the kind of finite element analysis selected, to be exported to a PATRAN neutral file (extension .out).

RadTherm
allows you to specify the surface(s) for which you want to write data and the method of writing the heat transfer coefficient, to be exported to a PATRAN neutral file (extension .nep). This option is available only when the Energy Equation is enabled.

Tecplot
allows you to specify the surface(s) and the scalars you want to write, to be exported to a Tecplot file.

Cell Zones
specifies the cell zones for which data is to be written for a CFD-Post compatible, EnSight, or FIELDVIEW file.

Surfaces
specifies the surfaces for which data is to be written for an ABAQUS, ASCII, Data Explorer, I-deas Universal, Mechanical APDL Input, NASTRAN, PATRAN, RadTherm, or Tecplot file.

Quantities
specifies valid functions for output. The attributes of the list are modified based on the active file type. The list may be a single-selection or a multiple-selection list or it may be disabled, depending on the selected File Type.
**Structural Loads**
contains optional structural loads that can be written to ABAQUS, I-deas Universal, Mechanical APDL Input, NASTRAN, and PATRAN files. This option is available only when **Structural** analysis is selected.

**Force**
enables force to be written as a load for a structural analysis.

**Pressure**
enables pressure to be written as a load for a structural analysis.

**Temperature**
enables temperature to be written as a load for a structural analysis. This option is available only when the **Energy Equation** is enabled.

**Thermal Loads**
contains optional thermal loads that can be written to ABAQUS, I-deas Universal, Mechanical APDL Input, NASTRAN, and PATRAN files. This option is available only when **Thermal** analysis is selected.

**Temperature**
enables temperature to be written as a load for a thermal analysis.

**Heat Flux**
enables heat flux to be written as a load for a thermal analysis.

**Heat Trans Coeff**
enables heat transfer coefficient to be written as a load for a thermal analysis.

**Location (for ASCII, CGNS, and EnSight Case Gold formats)**
specifies the location in the cell from which the values of scalar functions are to be taken.

**Node**
specifies that data values at the node points are to be exported.

**Cell Center**
specifies that data values from the cell centers are to be exported.

**Analysis (for ABAQUS, I-deas Universal, Mechanical APDL Input, NASTRAN, and PATRAN formats)**
specifies the finite element analysis intended.

**Structural**
specifies structural analysis and allows you to select the **Structural Loads** to be written.

**Thermal**
specifies thermal analysis and allows you to select the **Thermal Loads** to be written.

**Delimiter (for ASCII format only)**
specifies the delimiter used to separate the data fields.

**Comma**
specifies comma as the delimiter separating the data fields.

**Space**
specifies space as the delimiter separating the data fields.
Transient (for EnSight Case Gold only)
contains options for exporting transient data.

**Transient**
enables export of transient data.

**Separate Files for Each Timestep**
enables writing separate files for each timestep.

**Append Frequency**
specifies the frequency for appending the data during the solution process.

---

**Important**

The **Append Frequency** option is replaced by the **Write Frequency** option when **Separate Files for Each Timestep** is enabled. You can specify the frequency for writing the separate files.

---

**File Name**
specifies the root name for the files to be saved.

**Format (for EnSight Case Gold and CFD-Post Compatible)**
specifies the file format.

- **Binary**
specifies the file format as binary.

- **ASCII**
specifies the file format as ASCII.

**Heat Transfer Coefficient (for RadTherm format only)**
specifies the basis for the heat transfer coefficient exported.

- **Flux Based**
specifies the flux based method for writing the heat transfer coefficient.

- **Wall Function**
specifies the wall function based method for writing the heat transfer coefficient.

**Write Case File (for CFD-Post Compatible only)**
specifies whether or not a case file is written with the `.cdat` file.

**Write...**
opens **The Select File Dialog Box (p. 15)** for writing the specified function(s) in the specified format.

---

### 36.1.57. File/Export/Particle History Data...

The **File/Export/Particle History Data...** menu item opens the Export Particle History Data Dialog Box (p. 2390).

### 36.1.57.1. Export Particle History Data Dialog Box

The **Export Particle History Data** dialog box allows you to export particle history data as your solution progresses. See Exporting Steady-State Particle History Data (p. 82) for details.
Controls

**Type**

specifies the type of the file you want to write.

- **CFD-Post**
  - allows you to write the file in CFD-Post particle tracks format, which can be read in CFD-Post.

- **FieldView**
  - allows you to write the file in FIELDVIEW format, which can be read in FIELDVIEW.

- **EnSight**
  - allows you to write the file in EnSight format.

- **Geometry**
  - allows you to write the file in .ibl format, which can be read in GAMBIT (not available when Unsteady Particle Tracking is enabled under the Define/Models/Discrete Phase... menu option).

**Injections**

allows you to select the required injection from the list of predefined injections.

**Quantity**

contains the list of variables for which you can export the particle data.

**Skip**

allows you to “thin” or “sample” the number of particles that are exported.

**Coarsen**

reduces the exported file size by reducing the number of points that are written for a given trajectory. This is only valid for steady-state cases.

**Particle File Name**

allows you to specify the file name/directory for the exported data, using the Browse... button.

**Encas File Name**

is the file name you will specify if you selected EnSight under Type. Use the Browse... button to select the .encas file that was created when you exported the file with the File/Export... menu option.
36.1.58. File/Export/During Calculation/Solution Data...

The File/Export/During Calculation/Solution Data... menu item opens the Automatic Export Dialog Box (p. 2259) (transient cases only).

36.1.59. File/Export/During Calculation/Particle History Data...

The File/Export/During Calculation/Particle History Data... menu item opens the Automatic Particle History Data Export Dialog Box (p. 2263) (transient cases only).

36.1.60. File/Export to CFD-Post...

The File/Export to CFD-Post... menu item opens the Export to CFD-Post Dialog Box (p. 2392).

36.1.60.1. Export to CFD-Post Dialog Box

The Export to CFD-Post dialog box allows you to select the quantities that you would like to export to CFD-Post. See Exporting to ANSYS CFD-Post (p. 90) for details.
Controls

Select Quantities
contains a selectable list where you can choose the quantities to export.

Format
allows you to export the .cdat file in Binary or ASCII format.

Write Case File
specifies whether or not a case file is written with the .cdat file.

Open CFD-Post
specifies that after the files have been written, a CFD-Post session is opened, with the case and .cdat files loaded. CFD-Post will display the results.

Write...
opens the Select File dialog box, where you can specify the name and location of the exported files.

36.1.61. File/Solution Files...
The File/Solution Files... menu item opens the Solution Files Dialog Box (p. 2393).

36.1.61.1. Solution Files Dialog Box
The Solution Files dialog box allows you to manage the files that were created through the Autosave Dialog Box (p. 2256). See Managing Solution Files (p. 92) for details.

Controls

Solution Files at
contains a selectable list where you can choose the files to read or delete.

Read
makes the selected file the current file. Note that if more than one file is selected, the Read button is disabled. When an earlier solution is made current, the solution files that were generated for a later iteration/time step will be removed from this list when the calculation continues.
Delete
removes the selected solution files.

File Names...
allows you to obtain information about the solution files and the path of the associated files.

36.1.62. File/Interpolate...

The File/Interpolate... menu item opens the Interpolate Data Dialog Box (p. 2394).

36.1.62.1. Interpolate Data Dialog Box

The Interpolate Data dialog box allows you to interpolate solution data from one mesh to another. See Mesh-to-Mesh Solution Interpolation (p. 93) for details.

![Interpolate Data dialog box](image)

**Controls**

**Options** contains the interpolation options.

- **Read and Interpolate** allows you to read and interpolate solution data onto the current mesh.
- **Write Data** allows you to write an interpolation file for the solution data to be interpolated onto another mesh.

**Cell Zones** is a list of cell zones that can be selected.

**Binary File** allows you to write binary interpolation files. This option is available only when Write Data is selected under Options.
Fields
is a list of all available data fields that can be selected. This list is available only when Write Data is selected under Options.

Read...
opens The Select File Dialog Box (p. 15), in which you can specify the file to be read. This button is available only when the Read and Interpolate option is selected.

Write...
opens The Select File Dialog Box (p. 15), in which you can specify a name for the file to be saved and then save the file. This button replaces the Read... button when the Write Data option is selected.

36.1.63. File/FSI Mapping/Volume...
The File/FSI Mapping/Volume... menu item opens the Volume FSI Mapping Dialog Box (p. 2395).

36.1.63.1. Volume FSI Mapping Dialog Box
The Volume FSI Mapping dialog box allows you to map cell data for a given geometry from an ANSYS Fluent file onto a file with a different mesh and format. See Mapping Data for Fluid-Structure Interaction (FSI) Applications (p. 96) for a complete description of how to use the dialog box.

Controls
Input File
contains parameters related to the input file.

Type
contains the options for the format of the input mesh file.
ABAQUS
specifies that an ABAQUS file will be used as the input mesh file (extension .inp).

I-deas
specifies that an I-deas file will be used as the input mesh file (extension .unv).

Mechanical APDL
specifies that a Mechanical APDL file will be used as the input mesh file (extension .cdb or .neu).

NASTRAN
specifies that a NASTRAN file will be used as the input mesh file (extension .bdf).

PATRAN
specifies that a PATRAN file will be used as the input mesh file (extension .neu, .out, or .pat).

FEA File
specifies the name of the input mesh file (see the Input File Type descriptions for associated file extensions). If the file is not in the current working folder, include the full path to the folder where it is located.

Browse...
opens the Select File Dialog Box (p. 15), which you can use to specify the input mesh file instead of entering it in the Input File text-entry box.

Length Units
specifies the unit of length used in the input file.

Display Options
allows you to choose either the FEA Mesh or the ANSYS Fluent Mesh (or both).

Analysis
contains the options for the kind of data to be mapped.

Structural
specifies that data fields relevant for a structural analysis will be mapped.

Thermal
specifies that data fields relevant for a thermal analysis will be mapped.

Structural Loads
consists of a list of available loads, including Force, Pressure, and Temperature.

Fluent Zones
contains a list of available cell zones from the current ANSYS Fluent file from which cell data will be mapped.

Output File
contains the options for the format of the file that will be created from the input mesh file and the mapped data.

Type
contains the options for the format of the output mesh file.
ABAQUS
specifies that an ABAQUS file will be used as the output mesh file (extension .inp).

I-deas
specifies that an I-deas file will be used as the output mesh file (extension .unv).

Mechanical APDL
specifies that a Mechanical APDL file will be used as the output mesh file (extension .cdb).

NASTRAN
specifies that a NASTRAN file will be used as the output mesh file (extension .bdf).

PATRAN
specifies that a PATRAN file will be used as the output mesh file (extension .out).

File Name
specifies the name of the input mesh file (see the Output File descriptions for associated file extensions). If the file is not in the current working folder, include the full path to the folder where it is located.

Browse...
opens the The Select File Dialog Box (p. 15), which you can use to specify the input mesh file instead of entering it in the Input File text-entry box.

Include FEA Mesh
includes additional FEA information like node/element information in the exported output file.

Temperature Units
specifies the unit of temperature when mapping temperature for a structural analysis or any variable for a thermal analysis.

Read
reads the input file into memory.

Display
displays the selected mesh in the graphics window.

Write
writes an output file in which the selected ANSYS Fluent cell data is mapped onto the input mesh file.

36.1.64. File/FSI Mapping/Surface...

The File/FSI Mapping/Surface... menu item opens the Surface FSI Mapping Dialog Box (p. 2397).

36.1.64.1. Surface FSI Mapping Dialog Box

The Surface FSI Mapping dialog box allows you to map face data for a given geometry from an ANSYS Fluent file to a file with a different mesh and format. See Mapping Data for Fluid-Structure Interaction (FSI) Applications (p. 96) for a complete description of how to use the dialog box.
Controls

Input File
contains parameters related to the input file.

Type
contains the options for the format of the input mesh file.

- **ABAQUS**
specifies that an ABAQUS file will be used as the input mesh file (extension .inp).

- **I-deas**
specifies that an I-deas file will be used as the input mesh file (extension .unv).

- **Mechanical APDL**
specifies that a Mechanical APDL file will be used as the input mesh file (extension .cdb or .neu).

- **NASTRAN**
specifies that a NASTRAN file will be used as the input mesh file (extension .bdf).

- **PATRAN**
specifies that a PATRAN file will be used as the input mesh file (extension .neu, .out, or .pat).

FEA File
specifies the name of the input mesh file (see the **Input File Type** descriptions for associated file extensions). If the file is not in the current working folder, include the full path to the folder where it is located.
Browse... opens the **Select File** Dialog Box (p. 15), which you can use to specify the input mesh file instead of entering it in the **Input File** text-entry box.

**Length Units** specifies the unit of length used in the input file.

**Display Options** allows you to choose either the **FEA Mesh** or the **ANSYS Fluent Mesh** (or both).

**Analysis** contains the options for the kind of data to be mapped.

**Structural** specifies that data fields relevant for a structural analysis will be mapped.

**Thermal** specifies that data fields relevant for a thermal analysis will be mapped.

**Structural Loads** consists of a list of available loads, including **Force**, **Pressure**, and **Temperature**.

**Fluent Zones** contains a list of available face zones from the current ANSYS Fluent file from which cell data will be mapped.

**Output File** contains the options for the format of the file that will be created from the input mesh file and the mapped data.

**Type** contains the options for the format of the output mesh file.

**ABAQUS** specifies that an ABAQUS file will be used as the output mesh file (extension .inp).

**I-deas** specifies that an I-deas file will be used as the output mesh file (extension .unv).

**Mechanical APDL** specifies that a Mechanical APDL file will be used as the output mesh file (extension .cdb).

**NASTRAN** specifies that a NASTRAN file will be used as the output mesh file (extension .bdf).

**PATRAN** specifies that a PATRAN file will be used as the output mesh file (extension .out).

**File Name** specifies the name of the input mesh file (see the **Output File** descriptions for associated file extensions). If the file is not in the current working folder, include the full path to the folder where it is located.
Browse...  
opens the The Select File Dialog Box (p. 15), which you can use to specify the input mesh file instead of entering it in the Input File text-entry box.

Include FEA Mesh  
includes additional FEA information like node/element information in the exported output file.

Temperature Units  
specifies the unit of temperature when mapping temperature for a structural analysis or any variable for a thermal analysis.

HTC Type  
specifies the means of calculating the heat transfer coefficient.

ref-temp  
uses a temperature equal to the reference temperature to calculate the heat transfer coefficient.

cell-temp  
uses a temperature equal to the temperature of the cell adjacent to the face to calculate the heat transfer coefficient.

wall-func-htc  
calculates $h_{eff}$ using Equation 33.54 (p. 1825). Note that this option has the same definition as the field variable Wall Func. Heat Tran. Coef., as described in Alphabetical Listing of Field Variables and Their Definitions (p. 1787).

Read  
reads the input file into memory.

Display  
displays the selected mesh in the graphics window.

Write  
writes an output file in which the ANSYS Fluent data has been mapped to the mesh of the input file.

36.1.65. File/Save Picture...  
The File/Save Picture... menu item opens the Save Picture Dialog Box (p. 2309).

36.1.66. File/Data File Quantities...  
The File/Data File Quantities... menu item opens the Data File Quantities Dialog Box (p. 2258).

36.1.67. File/Batch Options...  
The File/Batch Options... menu item opens the Batch Options Dialog Box (p. 2400).

36.1.67.1. Batch Options Dialog Box  
The Batch Options dialog box allows you to select options to suppress interactive dialog boxes from ANSYS Fluent while running a case in batch mode. See Batch Execution Options in the Getting Started Guide for details.
Controls

Confirm File Overwrite
determines whether ANSYS Fluent confirms a file overwrite. This option is enabled by default.

Hide Questions
allows you to hide Question dialog boxes. This option is disabled by default.

Exit on Error
allows you to automatically exit from batch mode when an error occurs. This option is disabled by default.

36.1.68. File/Exit

The File/Exit menu item is used to exit from the current solver session.

36.2. Mesh Menu

For additional information, see the following sections:
36.2.1. Mesh/Check
36.2.2. Mesh/Info/Quality
36.2.3. Mesh/Info/Size
36.2.4. Mesh/Info/Memory Usage
36.2.5. Mesh/Info/Zones
36.2.6. Mesh/Info/Partitions
36.2.7. Mesh/Polyhedra/Convert Domain
36.2.8. Mesh/Polyhedra/Convert Skewed Cells...
36.2.9. Mesh/Merge...
36.2.10. Mesh/Separate/Faces...
36.2.11. Mesh/Separate/Cells...
36.2.12. Mesh/Fuse...
36.2.13. Mesh/Zone/Append Case File...
36.2.14. Mesh/Zone/Append Case & Data Files...
36.2.15. Mesh/Zone/Replace...
36.2.16. Mesh/Zone/Delete...
36.2.17. Mesh/Zone/Deactivate...
36.2.18. Mesh/Zone/Activate...
36.2.19. Mesh/Replace...
36.2.20. Mesh/Adjacency...
36.2.21. Mesh/Reorder/Domain
36.2.22. Mesh/Reorder/Zones
36.2.23. Mesh/Reorder/Print Bandwidth
36.2.24. Mesh/Scale...
36.2.1. Mesh/Check

The **Mesh/Check** menu item is used to verify the validity of the mesh. See *Checking the Mesh (p. 162)* for details.

36.2.2. Mesh/Info/Quality

The **Mesh/Info/Quality** menu item is used to display information about the quality of the mesh in the console, including the minimum orthogonal quality and the maximum aspect ratio. See *Mesh Quality (p. 129)* for details.

36.2.3. Mesh/Info/Size

The **Mesh/Info/Size** menu item is used to print out the number of nodes, faces, cells, and partitions in the mesh. See *Mesh Size (p. 166)* for details.

36.2.4. Mesh/Info/Memory Usage

The **Mesh/Info/Memory Usage** menu item is used to check the amount of memory used and allocated in the present analysis.

This feature reports the following information: the number of nodes, faces, cells, edges, and object pointers (generic pointers for various mesh and graphics utilities) that are used and allocated; the amount of array memory (scratch memory used for surfaces) used and allocated; and the amount of memory used by the solver process.

The memory information will be different for Linux and Windows systems. See *Memory Usage (p. 167)* for details.

36.2.5. Mesh/Info/Zones

The **Mesh/Info/Zones** menu item is used to print the total number of nodes for each face and cell zone, the number of faces or cells, the cell (and, in 3D, face) type (triangular, quadrilateral, and so on), the boundary condition type, and the zone ID. See *Mesh Zone Information (p. 168)* for details.

36.2.6. Mesh/Info/Partitions

The **Mesh/Info/Partitions** menu item is used to print out mesh partition statistics in the console window. See *Interpreting Partition Statistics (p. 1875)* for details.

---

**Important**

This report is the same as the one generated using the **Print Partitions** button in the **Partitioning and Load Balancing Dialog Box (p. 2508)**.
36.2.7. Mesh/Polyhedra/Convert Domain

The **Mesh/Polyhedra/Convert Domain** menu item is used to convert all 3D meshes (except pure hex meshes) to polyhedral cells. See [Converting the Domain to a Polyhedra](p. 169) for details.

---

**Important**

Conversion of a mesh to polyhedra only applies to 3D meshes that contain tetrahedral and/or wedge cells. Hexahedral cells remain unchanged during conversion.

---

36.2.8. Mesh/Polyhedra/Convert Skewed Cells...

The **Mesh/Polyhedra/Convert Skewed Cells...** menu item opens the [Convert Skewed Cells Dialog Box](p. 2403).

36.2.8.1. Convert Skewed Cells Dialog Box

The **Convert Skewed Cells** dialog box allows you to convert part of your domain to polyhedral cells. See [Replacing, Deleting, Deactivating, and Activating Zones](p. 187) for details. For information about converting skewed cells see [Using the Convert Skewed Cells Dialog Box](p. 174).

![Convert Skewed Cells Dialog Box](image)

**Controls**

- **Cell Zones**
  displays the zones that can be selected for cell conversion.

- **Maximum Cell Skewness**
  displays the cells skewness parameters of the current mesh.

  - **Current**
    displays the current maximum cell skewness of the mesh.
Cells Above Target (%) displays the percentage of cells that are above the **Target** skewness.

**Important**

The **Cells Above Target (%)** should be only a couple of percentage points, else the conversion will be ineffective due to the high face count.

**Target** allows you to specify the maximum allowable cell skewness.

**Important**

To update the **Cells Above Target (%)** Press **Enter** after entering **Target** value.

**Convert** converts the selected zones to polyhedral cells.

**Apply** saves the value entered for **Target**.

### 36.2.9. Mesh/Merge...

The **Mesh/Merge...** menu item opens the **Merge Zones Dialog Box** (p. 2404).

#### 36.2.9.1. Merge Zones Dialog Box

The **Merge Zones** dialog box allows you to merge multiple zones of the same type into a single zone. See **Merging Zones** (p. 176) for details.

**Controls**

**Multiple Types** contains a selectable list of the zone types for which you can merge multiple zones. You select a type and the corresponding zones of that type will be displayed in the **Zones of Type** list.
Zones of Type
contains a list from which you can select two or more zones to be merged into a single zone. The zones are of the type selected in the Multiple Types list.

Merge
merges the selected zones into a single zone. If your case file has dynamic zones or mesh interfaces, the Warning dialog box will open and require your input prior to the merge.

36.2.9.2. Warning Dialog Box
The Warning dialog box allows you to specify whether existing dynamic zones and/or mesh interfaces are deleted when you are using the Merge Zones dialog box to merge multiple zones of the same type into a single zone (see Merge Zones Dialog Box (p. 2404) for details). Note that dynamic zones and mesh interfaces that exist at the time of the merge may be adversely affected by the merge.

Controls
Cancel Merging
returns you to the Mesh Zones dialog box when you click OK, without initiating the merge.

Proceed at Your Own Risk
allows the merge to proceed when you click OK, without deleting the existing dynamic zones and mesh interfaces beforehand.

Proceed After Mesh Manipulation
deletes the existing dynamic zones and/or mesh interfaces (based on the settings in the Mesh Manipulation group box) and then merges the zones when you click OK.

Mesh Manipulation
allows you to specify whether the existing dynamic zones and/or mesh interfaces are deleted prior to the initiation of the merge. This group box is only available when Proceed After Mesh Manipulation is selected.

Dynamic Zones
specifies whether all existing dynamic zones are deleted prior to the merge.

Mesh Interfaces
specifies whether all existing mesh interfaces are deleted prior to the merge.
Note that selecting keep all from both drop-down lists in the Mesh Manipulation group box is the equivalent of selecting Proceed at Your Own Risk.

### 36.2.10. Mesh/Separate/Faces...

The Mesh/Separate/Faces... menu item opens the Separate Face Zones Dialog Box (p. 2406).

#### 36.2.10.1. Separate Face Zones Dialog Box

The Separate Face Zones dialog box allows you to separate a single face zone into multiple zones of the same type. See Separating Zones (p. 177) for details.

**Separate Face Zones**

- **Options**
  - **Angle** indicates that the face zone is to be separated based on significant angle (specified in the Angle field).
  - **Face** indicates that the face zone is to be separated by putting each face in the zone into its own zone.
  - **Mark** indicates that the face zone is to be separated based on the marks stored in adaption registers.
  - **Region** indicates that the face zone is to be separated based on contiguous regions.

- **Registers** contains a list of defined adaption registers. If you are separating faces by mark, select the adaption register to be used in the Registers list. When the separation is performed, all faces of cells that are marked will be placed into a new face zone.

- **Zones** contains a list of face zones from which you can select the zone to be separated.
Angle
specifies the significant angle to be used when you separate a face zone based on angle. Faces with normal vectors that differ by an angle greater than or equal to the specified significant angle will be placed in different zones when the separation occurs.

Separate
separates the selected face zone based on the specified parameters.

Report
reports what the result of the separation will be without actually separating the face zone.

36.2.11. Mesh/Separate/Cells...
The Mesh/Separate/Cells... menu item opens the Separate Cell Zones Dialog Box (p. 2407).

36.2.11.1. Separate Cell Zones Dialog Box
The Separate Cell Zones dialog box allows you to separate a single cell zone into multiple zones of the same type. See Separating Zones (p. 177) for details.

Controls

Options
specifies the method on which the cell-zone separation is to be based.

Mark
indicates that the cell zone is to be separated based on the marks stored in adaption registers.

Region
indicates that the cell zone is to be separated into two or more contiguous regions based on an internal boundary within the original zone.

Registers
contains a list of defined adaption registers. If you are separating the cell zone by mark, select the adaption register to be used in the Registers list. When the separation is performed, cells that are marked will be placed into a new zone.

Zones
contains a list of cell zones from which you can select the zone to be separated.
Separate
separates the selected cell zone based on the specified parameters.

Report
reports what the result of the separation will be without actually separating the cell zone.

36.2.12. Mesh/Fuse...

The Mesh/Fuse... menu item opens the Fuse Face Zones Dialog Box (p. 2408).

36.2.12.1. Fuse Face Zones Dialog Box

The Fuse Face Zones dialog box allows you to fuse boundaries (that is, remove duplicate nodes and faces and delete artificial internal boundaries) created by assembling multiple mesh regions. (See Reading Multiple Mesh/Case/Data Files (p. 143) for details on importing such meshes.) See Fusing Face Zones (p. 182) for information about using this dialog box.

Controls

Zones
contains a list of face zones from which you can select the boundaries to be fused.

Use default name for new fused zone
specifies whether to use an automatically generated default name for the fused zone.

Fused zone name
specifies the desired name for the fused zone if Use default name for new fused zone is disabled.

Tolerance
is a fraction of the minimum edge length of the face, used to determine whether or not nodes are coincident. If all of the appropriate faces do not get fused using the default Tolerance, you should increase it and attempt to fuse the zones again. The Tolerance should not exceed 0.5, or you may fuse the wrong nodes.

Fuse
fuses the selected zones. It is enabled only when you have selected a minimum of two zones.
36.2.13. Mesh/Zone/Append Case File...

The Mesh/Zone/Append Case File... menu item opens the Select File dialog box. This allows you to handle more than one mesh at a time within the same solver settings. See Reading Multiple Mesh/Case/Data Files (p. 143) for details.

36.2.14. Mesh/Zone/Append Case & Data Files...

The Mesh/Zone/Append Case & Data Files... menu item opens the Select File dialog box. This allows you to append data on the mesh. See Reading Multiple Mesh/Case/Data Files (p. 143) for details.

36.2.15. Mesh/Zone/Replace...

The Mesh/Zone/Replace... menu item opens the Replace Cell Zone Dialog Box (p. 2409).

36.2.15.1. Replace Cell Zone Dialog Box

The Replace Cell Zone dialog box allows you to replace a single cell zone or multiple zones. See Replacing, Deleting, Deactivating, and Activating Zones (p. 187) for details.

Controls

Case/Mesh File
allows you to specify a mesh file from which you want to replace the zone.

Existing Zones
contains a list of cell zones from which you can select the zone to be replaced.

Replace with
contains a list of cell zones from which you can select the zone to replace the zone selected in Existing Zones list.

Interpolate Data
allows you to enable/disable data interpolation if data already exists.

Replace
replaces the selected cell zone.
36.2.16. Mesh/Zone/Delete...

The Mesh/Zone/Delete... menu item opens the Delete Cell Zones Dialog Box (p. 2410)

36.2.16.1. Delete Cell Zones Dialog Box

The Delete Cell Zones dialog box allows you to delete a single cell zone or multiple zones. See Replacing, Deleting, Deactivating, and Activating Zones (p. 187) for details.

Controls

Cell Zones
contains a list of cell zones from which you can select the zone to be deleted.

Delete
deletes the selected cell zones.

36.2.17. Mesh/Zone/Deactivate...

The Mesh/Zone/Deactivate... menu item opens the Deactivate Cell Zones Dialog Box (p. 2410).

36.2.17.1. Deactivate Cell Zones Dialog Box

The Deactivate Cell Zones dialog box allows you to deactivate a single cell zone or multiple zones. See Replacing, Deleting, Deactivating, and Activating Zones (p. 187) for details.

Controls

Cell Zones
contains a list of cell zones from which you can select the zone to be deactivated.
Deactivate
deadivates the selected cell zones.

36.2.18. Mesh/Zone/Activate...

The Mesh/Zone/Activate... menu item opens the Activate Cell Zones Dialog Box (p. 2411).

36.2.18.1. Activate Cell Zones Dialog Box

The Activate Cell Zones dialog box allows you to activate a single cell zone or multiple zones. See Replacing, Deleting, Deactivating, and Activating Zones (p. 187) for details.

Controls

Cell Zones
contains a list of cell zones from which you can select the zone to be activated.

Activate
activates the selected cell zones.

36.2.19. Mesh/Replace...

The Mesh/Replace... menu item is used to replace the global mesh by reading an ANSYS Fluent mesh (.msh) file. If applicable, data will be interpolated onto the new mesh. See Replacing the Mesh (p. 191) for details.

The Mesh/Replace... menu item opens the Select File dialog box (see The Select File Dialog Box (p. 15)), which allows you to select the appropriate file to be read.

36.2.20. Mesh/Adjacency...

The Mesh/Adjacency... menu item opens the Adjacency Dialog Box (p. 2411).

36.2.20.1. Adjacency Dialog Box

The Adjacency dialog box allows you to identify, display, and rename face zones based on their adjacency to a selected cell zone. See Managing Adjacent Zones (p. 193) for details.
Cell Zone(s) contains a list of the cell zones for which you can find adjacent face zones.

Adjacent Face Zones contains a list of the face zones that are adjacent to the selected cell zones.

Options

Multiple Cell Zones allows you to select multiple cell zones at once. The zones listed in Adjacent Face Zones will be the union of all zones adjacent to the selected cell zones.

Rename Face Zones allows you to rename selected face zones based on adjacency or zone type.

Draw Default Mesh brings up the Mesh Display Dialog Box (p. 1891) where you can specify zones of the mesh to be permanently displayed as you display or hide face zones from within the Adjacency dialog box. This
can be helpful in cases where the mesh is very complex. If this option is not enabled, only the zones selected in **Adjacent Face Zones** will be displayed when you click **Display Face Zones**.

**On Selected Face Zones**
contains controls for renaming face zones that are selected in **Adjacent Face Zones**. For details on the renaming methods, refer to **Renaming Zones Using the Adjacency Dialog Box** (p. 195)

**Rename by Adjacency**
renames the selected face zones incorporating the name of the adjacent cell zone and the face zone type.

**Rename to Default**
renames the selected face zones with default names based on the face zone type and, if necessary to avoid duplicate names, the zone id.

**Rename by Wildcard**
renames the selected face zones based on a pattern match string in the **From** text box and a replacement string in the **To** text box.

**Abbreviate Types**
uses abbreviations for the zone types when renaming rather than the full zone type text.

**Exclude Custom Names**
excludes from renaming any zones that do not match a recognized naming pattern. This can be useful to prevent inadvertently replacing a meaningful name.

**Cell Zone Types**
allows you to select or deselect cell zones based on zone type.

**Face Zone Types**
allows you to select or deselect face zones based on zone type.

**Face Zone Name Pattern**
allows you to select or deselect face zones by entering a pattern (optionally with * as wildcards) and clicking **Match**. Matching zones will be added to the selection. If all matching zones are already selected, they will be deselected.

**Displace Face Zones**
displays the face zones selected in **Adjacent Face Zones**.

### 36.2.21. Mesh/Reorder/Domain

The **Mesh/Reorder/Domain** menu item will reorder the nodes, faces, and cells along zones and in memory in order to increase memory access efficiency. See **Reordering the Domain and Zones** (p. 195) for details.

### 36.2.22. Mesh/Reorder/Zones

The **Mesh/Reorder/Zones** menu item will reorder the zones first by type and then by ID, for user-interface convenience. See **Reordering the Domain and Zones** (p. 195) for details.
36.2.23. Mesh/Reorder/Print Bandwidth

The Mesh/Reorder/Print Bandwidth menu item is used to print the semi-bandwidth and maximum memory distance for each mesh partition. See Reordering the Domain and Zones (p. 195) for details.

36.2.24. Mesh/Scale...

The Mesh/Scale... menu item opens the Scale Mesh Dialog Box (p. 1890).

36.2.25. Mesh/Translate...

The Mesh/Translate... menu item opens the Translate Mesh Dialog Box (p. 2414).

36.2.25.1. Translate Mesh Dialog Box

The Translate Mesh dialog box allows you to change the origin of the mesh. See Translating the Mesh (p. 198) for details.

Controls

Translation Offsets
contains the desired changes in the mesh coordinates (that is, the desired delta in the axes origin). You can enter a positive or negative real number.

\[ X, Y, Z \]

defines the deltas in the \( x \), \( y \), and \( z \) directions, in the current units of length.

Domain Extents
displays the Cartesian coordinate extremes of the nodes in the mesh. (These values are not editable; they are purely informational.)

\[ X_{\text{min}}, Y_{\text{min}}, Z_{\text{min}} \]

shows the minimum values of Cartesian coordinates in the mesh.
**Xmax, Ymax, Zmax**

shows the maximum values of Cartesian coordinates in the mesh.

**Translate**

adds the specified translation offsets to the appropriate Cartesian coordinate of every node in the mesh.

**36.2.26. Mesh/Rotate...**

The **Mesh/Rotate...** menu item opens the **Rotate Mesh Dialog Box (p. 2415)**.

**36.2.26.1. Rotate Mesh Dialog Box**

The **Rotate Mesh** dialog box allows you to rotate the mesh about the required axis and rotation origin by specifying the angle of rotation. See **Rotating the Mesh (p. 199)** for details.

**Controls**

**Rotation Angle**

is the angle with which you want to rotate the mesh. You can enter a positive or negative real number.

**Rotation Origin**

defines the new origin for the mesh rotation.

**Rotation Axis**

defines the axis about which you want to rotate the mesh.

**Domain Extents**

displays the Cartesian coordinate extremes of the nodes in the mesh. (These values are not editable; they are purely informational.)
Rotate
adds the specified rotation parameters to the appropriate Cartesian coordinate of every node in the mesh.

36.2.27. Mesh/Smooth/Swap...

The Mesh/Smooth/Swap... menu item opens the Smooth/Swap Mesh Dialog Box (p. 2480), which controls smoothing and diagonal swapping. See Improving the Mesh by Smoothing and Swapping (p. 1572) for details about its use.

36.3. Define Menu

For additional information, see the following sections:
  36.3.1. Define/General...
  36.3.2. Define/Models...
  36.3.3. Define/Materials...
  36.3.4. Define/Phases...
  36.3.5. Define/Cell Zone Conditions...
  36.3.6. Define/Boundary Conditions...
  36.3.7. Define/Operating Conditions...
  36.3.8. Define/Mesh Interfaces...
  36.3.9. Define/Dynamic Mesh...
  36.3.10. Define/Mesh Morpher/Optimizer...
  36.3.11. Define/Mixing Planes...
  36.3.12. Define/Turbo Topology...
  36.3.13. Define/Injections...
  36.3.14. Define/DTRM Rays...
  36.3.15. Define/Shell Conduction Manager...
  36.3.16. Define/Custom Field Functions...
  36.3.17. Define/Parameters...
  36.3.18. Define/Profiles...
  36.3.19. Define/Units...
  36.3.20. Define/User-Defined/Functions/Interpreted...
  36.3.21. Define/User-Defined/Functions/Compiled...
  36.3.22. Define/User-Defined/Functions/Manage...
  36.3.23. Define/User-Defined/Function Hooks...
  36.3.24. Define/User-Defined/Execute on Demand...
  36.3.25. Define/User-Defined/Scalars...
  36.3.26. Define/User-Defined/Memory...
  36.3.27. Define/User-Defined/1D Coupling...

36.3.1. Define/General...

The Define/General... menu item opens the General Task Page (p. 1888).

36.3.2. Define/Models...

The Define/Models... menu item opens the Models Task Page (p. 1896).
36.3.3. Define/Materials...

The Define/Materials... menu item opens the Materials Task Page (p. 2020).

36.3.4. Define/Phases...

The Define/Phases... menu item opens the Phases Task Page (p. 2071).

36.3.5. Define/Cell Zone Conditions...

The Define/Cell Zone Conditions... menu item opens the Cell Zone Conditions Task Page (p. 2083).

36.3.6. Define/Boundary Conditions...

The Define/Boundary Conditions... menu item opens the Boundary Conditions Task Page (p. 2102).

36.3.7. Define/Operating Conditions...

The Define/Operating Conditions... menu item opens the Operating Conditions Dialog Box (p. 2095).

36.3.8. Define/Mesh Interfaces...

The Define/Mesh Interfaces... menu item opens the Mesh Interfaces Task Page (p. 2172).

36.3.9. Define/Dynamic Mesh...

The Define/Dynamic Mesh... menu item opens the Dynamic Mesh Task Page (p. 2175).

36.3.10. Define/Mesh Morpher/Optimizer...

The Define/Mesh Morpher/Optimizer... menu item opens the Mesh Morpher/Optimizer Dialog Box (p. 2417).

36.3.10.1. Mesh Morpher/Optimizer Dialog Box

The Mesh Morpher/Optimizer dialog box allows you to use the mesh morpher/optimizer to deform the mesh in order to solve shape optimization problems. You can deform the mesh manually, allow a built-in optimizer to define the deformation in order to minimize an objective function, or use Design Exploration in ANSYS Workbench to easily explore a variety of deformation scenarios. See Setting Up the Mesh Morpher/Optimizer (p. 676) for further details.
Controls

Regions

The **Regions** tab allows you to define the regions of the domain where the mesh will be deformed in order to optimize the shape.

Name

Name provides controls for the deformation regions you are defining. The upper text-entry box defines the name of the region that is created when you click the **Create** button. The lower selection list allows you to select a region that has already been created, in order to display it in the graphics window, modify the settings via the **Modify** button, or delete the region via the **Delete** button.

Update from Zones

Update from Zones allows you to create a bounding box that defines the deformation region.
Boundary Zones
specifies the boundary zones that will be used to generate a bounding box for the deformation region when you click the **Define** button.

Define
updates the values in the **Origin**, **Direction-1 Vector**, **Direction-2 Vector**, and **Size of Region** group boxes based on a bounding box that encompasses the selections in the **Boundary Zones** list.

Enlarge
increases the size of the bounding box created by the **Define** button.

Reduce
decreases the size of the bounding box created by the **Define** button.

Update from Plane Tool
updates the values in the **Direction-1 Vector** and **Direction-2 Vector** group boxes based on the settings in the plane tool. See Using the Plane Tool (p. 1591) for information about the plane tool. This button is only available for 3D cases.

Update from Line Tool
updates the values in the **Direction-1 Vector** and **Direction-2 Vector** group boxes based on the settings in the line tool. See Using the Line Tool (p. 1587) for information about the line tool. This button is only available for 2D cases.

Origin
allows you to define the Cartesian coordinates of the origin of the deformation region.

  X
defines the x coordinate of the origin of the deformation region.

  Y
defines the y coordinate of the origin of the deformation region.

  Z
defines the z coordinate of the origin of the deformation region. This number-entry box is only available for 3D cases.

Direction-1 Vector
allows you to define a vector that acts as the first direction of the deformation region relative to the **Origin**.

  X
defines the x component of the first direction vector of the deformation region.

  Y
defines the y component of the first direction vector of the deformation region.

  Z
defines the z component of the first direction vector of the deformation region. This number-entry box is only available for 3D cases.

Direction-2 Vector
defines a vector that is used to calculate the second direction of the deformation region relative to the **Origin**. For 2D cases, the values in the **Direction-2 Vector** group box are automatically defined
by ANSYS Fluent to be perpendicular to the Direction-1 Vector. For 3D cases, the vector defined by the Direction-2 Vector group box is projected onto a plane that intersects the Origin and is perpendicular to the vector defined in the Direction-1 Vector group box, in order to calculate the second direction.

**X**
defines the x component of the vector used to calculate the second direction of the deformation region. This number-entry box is only editable for 3D cases.

**Y**
defines the y component of the vector used to calculate the second direction of the deformation region. This number-entry box is only editable for 3D cases.

**Z**
defines the z component of the vector used to calculate the second direction of the deformation region. This number-entry box is only available for 3D cases.

**Size of Region**
allows you to define the overall dimensions of the deformation region.

**Direction-1**
defines the length of the deformation region along the direction specified by the Direction-1 Vector group box.

**Direction-2**
defines the length of the deformation region along the direction specified by the Direction-2 Vector group box.

**Direction-3**
defines the length of the deformation region along the third axis (that is, the cross product of the vectors defined by the Direction-1 Vector and Direction-2 Vector group boxes). This number-entry box is only available for 3D cases.

**Control Points**
allows you to define the number of control points for each axis of the deformation region. The number of control points must be the same for all regions in each direction.

**Direction-1**
defines the number of control points for the deformation region along the direction specified by the Direction-1 Vector group box.

**Direction-2**
defines the number of control points for the deformation region along the direction specified by the Direction-2 Vector group box.

**Direction-3**
defines the number of control points for the deformation region along the third axis (that is, the cross product of the vectors defined by the Direction-1 Vector and Direction-2 Vector group boxes). This number-entry box is only available for 3D cases.

**Create**
creates a new deformation region with the name specified in the upper text-entry box of the Name group box and with the settings defined in the Origin, Direction-1 Vector, Direction-2 Vector, Size
of Region, and Control Points group boxes. The newly created deformation region will be added to and selected in the lower Name selection list, and will be displayed in the graphics window.

Modify
modifies the saved settings for the deformation region selected in the lower Name selection list and displays the modified region in the graphics window.

Delete
deletes the deformation region selected in the lower Name selection list.

Constraints
tab allows you to define the constraints on the boundary zones, in order to limit the freedom of particular zones that fall within the deformation region(s) during the morphing of the mesh.

Zone
selects the boundary zone for which you are defining a constraint.

Options
specifies the constraint on the boundary zone selected from the Zones list.

Unconstrained
specifies that the boundary zone is completely free to be deformed according to the assigned parameters.

Passive
specifies that the nodes of the boundary zone are partially constrained to varying degrees, based on their proximity to adjacent boundary zones that are fixed. The nodes in a passive boundary zone behave in a similar manner to the interior mesh nodes, in order to ensure that there is a smooth transition between fixed and unconstrained boundary zones.

Fixed
specifies that the boundary zone is fixed and will not be deformed.

Display
displays the selected Zone in the graphics window.

Summary
prints a list in the console that summarizes the constraint definitions for all of the boundary zones.

Deformation
tab allows you to define the deformation.

Number of Parameters
defines the number of parameters available to be assigned to control points.

Parameter Values
allows you to define either the magnitude of deformation associated with each parameter (when you are manually specifying the deformation or using Design Exploration in ANSYS Workbench to explore multiple deformation scenarios) or the bounds for each parameter (when you are using a built-in optimizer).

par1, par2...
specify the magnitude of deformation associated with each parameter. You can enter a numeric value in the field or use the icon to create or assign an input parameter (see Select Input
Parameter Dialog Box (p. 2097) for details). These fields and icons are only available when none or workbench is selected from the Optimizer drop-down list in the Optimizer tab.

Apply
saves definitions for the parameter fields in the Parameter Values group box. This button is only available when none or workbench is selected from the Optimizer drop-down list in the Optimizer tab.

Set Bounds...
opens the Parameter Bounds Dialog Box (p. 2424), where you can defining strict minimum and maximum values for the parameters. Note that this button is not available when workbench is selected from the Optimizer drop-down list in the Optimizer tab.

Scaling Factor Settings...
opens the Scaling Factor Settings Dialog Box (p. 2425), where you can assign scaling factors and parameters to the control points of the regions.

Deform
applies the current settings in the Parameter Values group box, modifies the mesh, and updates the mesh display in the graphics window. This button is only available when none is selected from the Optimizer drop-down list in the Optimizer tab.

Check
displays a mesh check report in the console for the mesh displayed in the graphics window. This button is only available when none is selected from the Optimizer drop-down list in the Optimizer tab. The mesh check report provides volume statistics, mesh topology and periodic boundary information, verification of simplex counters, and verification of node position with reference to the $x$ axis for axisymmetric cases, in the same manner as the Check button in the General task page (see Checking the Mesh (p. 162) for details).

Reset
undoes any modifications made to the mesh as a result of the Deform button and updates the mesh display in the graphics window.

Optimizer
tab allows you to define the settings for the optimizer.

Optimizer
specifies which optimizer is used. The choices include none (for manual deformation); compass, newuoa, powell, rosenbrock, simplex, and torczon (for optimization in ANSYS Fluent); and workbench (for optimizing using Design Exploration in ANSYS Workbench). Note that workbench is only available if you have launched your ANSYS Fluent session from ANSYS Workbench. For information about how the built-in optimizers function or how to use Design Exploration, see Modeling Flows Using the Mesh Morpher/Optimizer in the User's Guide or Working With Input and Output Parameters in Workbench in the ANSYS Fluent in Workbench User's Guide, respectively.

Objective Function Definition...
opens the Objective Function Definition Dialog Box (p. 2428), where you can specify the format of the objective function that will be minimized during the optimization process. This button is not available if none or workbench is selected from the Optimizer drop-down list.

Optimizer Settings
allows you to specify the optimizer settings. This group box is not available if none or workbench is selected from the Optimizer drop-down list.
Maximum Number of Designs
defines the maximum number of design stages the optimizer will undergo to reach the specified objective function.

Maximum Iterations per Design
defines the maximum number of iterations ANSYS Fluent will perform for each design change.

Optimizer Convergence Criteria
defines the convergence criteria for the optimizer.

Initial Parameter Variation
defines how much the parameters will be allowed to vary during the initial calculations when newuoa is selected from the Optimizer drop-down list.

Mesh Quality
allows you to enable and define a mesh quality check: if the orthogonal quality (as defined in Mesh Quality (p. 129)) for any cell of a mesh is less than a specified value, no solution is calculated for the mesh and Fluent proceeds to the next design stage. This group box is not available if none is selected from the Optimizer drop-down list.

Reject Poor Quality Meshes
enables the consideration of orthogonal quality when determining whether a solution should be calculated for a mesh.

Minimum Orthogonal Quality
defines the minimum orthogonal quality value every cell must have in order for a solution to be calculated for a mesh. Values may range from 0–1 (where 0 represents the worst quality).

Case and Data File Sets
allows you to enable the automatic saving of intermediate case and data files at specified intervals during the optimization run, so that you can restart an interrupted solution in the same or a different Fluent session without increasing the overall number of design iterations needed to reach convergence. This group box is not available if none or workbench is selected from the Optimizer drop-down list.

Save Every
specifies the frequency (in number of design iterations) that you want intermediate case and data file sets saved. Note that the default value is 0, which specifies that no intermediate files will be saved.

Maximum Number Retained
specifies the maximum number of intermediate case and data files sets you want to retain. After the maximum limit of file sets has been saved, ANSYS Fluent begins overwriting the earliest existing intermediate file set.

File Name
specifies a root name for the intermediate case and data file sets, which will be appended with a number that represents the design iteration during which it was saved. Note that you can include a folder path in the file name if you want the files saved outside of the working folder.

Initialization
provides settings that determine how the solution variables are treated after the mesh is deformed during the optimization process. This group box is not available if none or workbench is selected from the Optimizer drop-down list.
Method
allows you to select one of the following:

**Initialize Data After Morphing**
specifies that the solution variables should be initialized to the values defined in the Solution Initialization task page after deformation.

**Continue with Current Data**
specifies that the solution variables should remain the values obtained in the previous design iteration.

**Read Data File After Morphing**
specifies that the solution variables are set to the values obtained from the data file specified in the Data File Name text-entry box after deformation. This selection is not available when newuoa is selected from the Optimizer drop-down list.

**Data File Name**
specifies the data file from which the solution variables are obtained when Read Data File After Morphing is selected.

**Execute Commands**
allows you to specify commands (text commands or command macros) that will be executed during the optimization runs of the mesh morpher/optimizer. This group box is not available if none, newuoa, or workbench is selected from the Optimizer drop-down list.

**Initial Commands**
specifies the commands that will be executed after the design has been modified, but before ANSYS Fluent has started to run the calculation for that design stage.

**End Commands**
specifies the commands that will be executed after the solution has run and converged for a design stage.

**Monitor...**
opens the Optimization History Monitor Dialog Box (p. 2429), which allows you to plot and/or record how the value of the objective function varies with each design stage. This button is not available if none, newuoa, or workbench is selected from the Optimizer drop-down list.

**Apply**
saves the settings in the Optimizer tab.

**Summary**
displays a summary of the mesh morpher/optimizer settings in the console.

**Optimize**
initiates the optimization process using the settings saved in all of the tabs of the Mesh Morph/Optimizer dialog box. This button is not available if none or workbench is selected from the Optimizer drop-down list.

### 36.3.10.2. Parameter Bounds Dialog Box

The Parameter Bounds dialog box allows you to limit how much each parameter is allowed to deform when using the mesh morpher/optimizer. See Setting Up the Mesh Morph/Optimizer (p. 676) for details about using this dialog box.
Controls

Parameters
selects the parameters (created using the Deformation tab of the Mesh Morpher/Optimizer Dialog Box (p. 2417)) for which you are defining bounds.

Range
allows you to specify the bounds.

Unbounded
allows you to specify whether the selected Parameters are unbounded.

Min, Max
allows you to set the minimum and maximum values allowed for the selected Parameters when the Unbounded option is disabled.

Apply
saves the bounds for the currently selected Parameters.

Summary
displays a summary of all of the saved parameter bounds in the console.

36.3.10.3. Scaling Factor Settings Dialog Box

The Scaling Factor Settings dialog box allows you to assign scaling factors and parameters to the control points of the regions, as part of the definition of the deformation produced by the mesh morpher/optimizer. See Setting Up the Mesh Morpher/Optimizer (p. 676) for details about using this dialog box.
Controls

Region
selects the deformation region for which you are assigning parameters and scaling factors to control points.

Control Points
defines the control points to which you are assigning parameters and scaling factors.

Selection Tools
provides tools for selecting the control points to which you are assigning parameters and scaling factors.

Multi-Probe
allows you to specify the Control Points by clicking in the graphics window with the mouse-probe button of the mouse.

Indexed Grouping
allows you to select the control points based on their assigned indices.

Indexed Grouping
allows you to select from a list of control point index numbers, which identify the location in a sequence (starting at the origin of the region) of control points along the direction-1 vector (as defined in the Regions tab of the Mesh Morpher/Optimizer dialog box).
allows you to select from a list of control point index numbers, which identify the location in a sequence (starting at the origin of the region) of control points along the direction-2 vector (as defined in the Regions tab of the Mesh Morpher/Optimizer dialog box).

allows you to select from a list of control point index numbers, which identify the location in a sequence (starting at the origin of the region) of control points along the direction-3 vector (as defined in the Regions tab of the Mesh Morpher/Optimizer dialog box).

Select adds the control points that satisfy the selected index criteria (that is, the selections from the I, j, and k drop-down lists) to the list of selected Control Points.

Deselect removes the control points that satisfy the selected index criteria (that is, the selections from the I, j, and k drop-down lists) from the list of selected Control Points.

Parameters specifies the names of the parameters (whose values are displayed in the Parameter Values group box in the Deformation tab of the Mesh Morpher/Optimizer dialog box) that you are assigning to the Control Points. The products of the values associated with these parameters and the settings specified in the Scaling Factors group box are summed to define the displacement of the control points during manual deformation.

Scaling Factors allows you to define coefficients in the x, y, and (for 3D cases) z directions to scale the magnitude of deformation for the selected parameters. If you use a built-in optimizer, these coefficients provide the direction of the displacement of the control points and the optimizer determines the overall magnitude of displacement. Alternatively, if you manually specify the deformation or use Design Exploration in ANSYS Workbench to explore multiple deformation scenarios, the values you enter in the Scaling Factors group box are multiplied with the values of the Parameters (as displayed in the Parameter Values group box in the Deformation tab of the Mesh Morpher/Optimizer dialog box) to define the displacement of the control points.

X defines the scaling coefficient applied to the deformation parameter in the x direction.

Y defines the scaling coefficient applied to the deformation parameter in the y direction.

Z defines the scaling coefficient applied to the deformation parameter in the z direction. This number-entry box is only available for 3D cases.

Apply saves the selections made in the Parameters selection list and the values entered in the Scaling Factor group box, and assigns these parameter settings to the control points selected in the Control Points selection list.

Read from File... allows you to define your scaling factor settings by reading an ASCII text file.
Write to File... allows you to write your saved scaling factor settings to an ASCII text file.

### 36.3.10.4. Objective Function Definition Dialog Box

The **Objective Function Definition** dialog box allows you to specify the format of the objective function that will be minimized by the mesh morpher/optimizer and (when it is a customized function of output parameters) to define the objective function. See [Setting Up the Mesh Morpher/Optimizer (p. 676)](#) for details about using this dialog box.

![Objective Function Definition Dialog Box](image)

**Controls**

**Options** contains options for the format of the objective function.

- **User-Defined Function** specifies that the objective function is provided via a user-defined function.

- **Scheme Procedure** specifies that the objective function is provided via a Scheme source file. This option is not available if **newuoa** is selected from the **Optimizer** drop-down list in the **Optimizer** tab of the **Mesh Morpher/Optimizer** dialog box.
**Custom Calculator**

specifies that the objective function is based on output parameters, and is defined by the GUI controls in the Custom Calculator group box. This option is not available if newuoa is selected from the Optimizer drop-down list in the Optimizer tab of the Mesh Morpher/Optimizer dialog box.

**Custom Calculator**

allows you to define the objective function. This group box is only available when Custom Calculator is selected from the Options list.

**Function to Minimize**

displays the objective function defined by the GUI controls in the Custom Calculator group box.

**Select Operand from**

allows you to include output parameters in the definition of the objective function.

**Output Parameters**

provides a list of available output parameters, which can be included in the definition of the objective function.

**Parameters...**

opens the Parameters Dialog Box (p. 2367), which you can use to create additional output parameters.

**Refresh**

updates the Output Parameters list, so that all available output parameters are displayed.

**Select**

enters the output parameter that is currently selected in the Output Parameters list in the Function to Minimize text box.

**Operators**

allows you to include calculator operators in the definition of the objective function. Clicking a button in this group box causes the appropriate symbol to appear in the Function to Minimize text box.

**Apply**

saves the custom objective function (displayed in the Function to Minimize text box) as part of the case file.

**Clear**

deletes all of the text in the Function to Minimize text box.

**36.3.10.5. Optimization History Monitor Dialog Box**

The Optimization History Monitor dialog box allows you to plot and/or record optimization history data, that is, how the value of the objective function (defined using the Mesh Morpher/Optimizer Dialog Box (p. 2417)) varies with each design stage produced by the mesh morpher/optimizer. See Setting Up the Mesh Morpher/Optimizer (p. 676) for details about using this dialog box.
Controls

Plot

enables the plotting of the optimization history data in the graphics window (with the ID specified in Window).

Window

sets the ID of the graphics window in which the plot will be displayed. This number-entry box is only available when the Plot option is enabled. While ANSYS Fluent is iterating, the active graphics window is temporarily set to this ID to update the optimization history plot, and then it is returned to its previous value. Thus, the optimization history plot can be maintained in a separate window that does not interfere with other graphical postprocessing.

Write

enables the saving of the optimization history data to a file (with the name specified in File Name).

File Name

specifies the name of the file to which the optimization history data is written. This text-entry box is only available when the Write option is enabled.

Plot

displays an XY plot of the optimization history data generated during the last calculation. Note that no plot will be displayed if the data was discarded using the Clear button.

Clear

discards the optimization history data, including the associated files. Each of these actions must be confirmed in a Question Dialog Box (p. 15).

36.3.11. Define/Mixing Planes...

The Define/Mixing Planes... menu item opens the Mixing Planes Dialog Box (p. 2430).

36.3.11.1. Mixing Planes Dialog Box

The Mixing Planes dialog box allows you to define the mixing planes for a mixing plane model. See Setting Up the Mixing Plane Model (p. 551) for details about using the items below.
Controls

Mixing Plane
contains a list from which you can select an existing mixing plane, and an informational field in which ANSYS Fluent displays the name of the currently selected (or most recently created) mixing plane.

Upstream Zone, Downstream Zone
contain lists from which you can select the boundaries on the upstream and downstream sides of the mixing plane, and informational fields that show the names of the zone you selected in each list. (You cannot edit these fields; the name in each field will be the name of the zone you selected in the list below it.)

Interpolation Points
specifies the number of radial or axial locations used in constructing the boundary profiles for circumferential averaging. This item appears only in 3D.

Mixing Plane Geometry
defines the geometry of the mixing plane interface. This item appears only in 3D.

Radial
specifies that information at the mixing plane interface is to be circumferentially averaged into profiles that vary in the radial direction, for example, $p(r), T(r)$.

Axial
specifies that circumferentially averaged profiles are to be constructed that vary in the axial direction, for example, $p(x), T(x)$.

Global Parameters
contains parameters related to the mixing plane calculation.

Averaging Method
consists of three profile averaging methods.
Area
is the default method and is expressed using Equation 2.17 in the Theory Guide.

Mass
provides better representation of the total quantities than the area averaging method. It is defined by Equation 2.18 of the Theory Guide.

Mixed-Out
is most representative of non-uniform flow profiles and is expressed using Equation 2.20 in the Theory Guide.

Under-Relaxation
specifies the under-relaxation factor for updating the boundary values at mixing planes.

Apply
sets the specified Under-Relaxation.

Default
sets the Under-Relaxation to its default value, as assigned by ANSYS Fluent. After execution, the Default button becomes the Reset button.

Reset
resets the Under-Relaxation to its most recently saved value (that is, the value before Default was selected). After execution, the Reset button becomes the Default button.

Create
creates the specified mixing plane (and assigns it a name in the Mixing Plane field).

Delete
deletes the mixing plane selected under Mixing Plane.

36.3.12. Define/Turbo Topology...
The Define/Turbo Topology... menu item opens the Turbo Topology Dialog Box (p. 2432).

36.3.12.1. Turbo Topology Dialog Box
The Turbo Topology dialog box allows you to define the topology for a turbomachinery application, so that you can use the turbomachinery-specific postprocessing features described in Turbomachinery Postprocessing (p. 1713). See Defining the Turbomachinery Topology (p. 1713) for details about the items below.
Controls

**Turbo Topology Name**
- specifies the name of the new topology.

**Boundaries**
- contains radio buttons for the topology boundaries to be defined.
  
  **Hub**
  - specifies the definition for the wall zone(s) forming the lower boundary of the flow passage (generally toward the axis of rotation of the machine).

  **Casing**
  - specifies the definition of the wall zone(s) forming the upper boundary of the flow passage (away from the axis of rotation of the machine).

  **Theta Periodic**
  - specifies the definition of the periodic boundary zone(s) on the circumferential boundaries of the flow passage.

  **Theta Min, Theta Max**
  - specify the definition of the wall zones at the minimum and maximum angular (θ) positions on a circumferential boundary.

  **Inlet**
  - specifies the definition of the inlet zone(s) through which the flow enters the passage.

  **Outlet**
  - specifies the definition of the outlet zone(s) through which the flow exits the passage.
Blade
specifies the definition of the wall zone(s) that defines the blade(s) (if any). Note that these zones cannot be attached to the circumferential boundaries. For this situation, use Theta Min and Theta Max to define the blade.

Surfaces
contains a selectable list of the available surfaces, from which you can select the surface(s) that represent the boundary selected under Boundaries.

Surface Name Pattern
specifies the pattern to look for in the names of surfaces. Type the pattern in the text field and click Match to select (or deselect) the zones in the Surfaces list with names that match the specified pattern. See Defining the Turbomachinery Topology (p. 1713) for information about matching additional characters using * and ?.

Surface Types
contains a selectable list of types of surfaces. If you select (or deselect) an item in this list, all surfaces of that type will be selected (or deselected) automatically in the Surfaces list.

Define
defines the new topology. If you have selected an existing topology the Define button is replaced by the Modify button.

Display
draws the defined topology in the active graphics window.

36.3.13. Define/Injections...

The Define/Injections... menu item opens the Injections Dialog Box (p. 2434).

36.3.13.1. Injections Dialog Box

The Injections dialog box allows you to create, delete, and list discrete phase injections, and access the Set Injection Properties Dialog Box (p. 2436) and the Set Multiple Injection Properties Dialog Box (p. 2442), in which you can set the properties for the injections. See Creating and Modifying Injections (p. 1174) for details.
Controls

Injections
contains a list from which you can select one or more injections in order to set, copy, or modify properties, or delete or list injections.

Create
creates a new injection and opens the Set Injection Properties Dialog Box (p. 2436), in which you can set its properties.

Copy
creates a new injection with the same properties as the selected injection and opens the Set Injection Properties Dialog Box (p. 2436) where the new injection's properties can be modified.

Delete
deletes the injection(s) selected in the Injections list.

List
lists the initial conditions for the particle streams in the injection(s) selected in the Injections list.

Read...
opens the The Select File Dialog Box (p. 15) where you will select the injection file to read in.

Write...
allows you to select the injection from the list and write it to a file.

Injection Name Pattern
specifies the pattern to look for in the names of injections. Type the pattern in the text field and click Match to select (or deselect) the injections in the Injections list with names that match the specified pattern. See Shortcuts for Selecting Injections (p. 1176) for information about matching additional characters using * and ?.
Set...
opens the Set Injection Properties Dialog Box (p. 2436) for the injection selected in the Injections list or the Set Multiple Injection Properties Dialog Box (p. 2442) if more than one injection is selected in the Injections list.

36.3.13.2. Set Injection Properties Dialog Box

The Set Injection Properties dialog box allows you to define the properties of an existing discrete-phase injection (which was created in the Injections Dialog Box (p. 2434)). This dialog box is opened from the Injections dialog box. See Defining Injection Properties (p. 1176) for details about the items listed in this section.

Controls

Injection Name
sets the name of the injection.

Injection Type
contains a drop-down list of the available injection types: single, group, cone, solid-cone, surface, plain-orifice-atomizer, pressure-swirl-atomizer, air-blast-atomizer, flat-fan-atomizer, effervescent-atomizer, and file. (cone is not available in 2D.) These choices are described in Injection Types (p. 1158).

Number of Streams
indicates the number of particle streams in a group, cone, solid-cone, or any of the atomizer injections. (This item will not appear for single, surface, or file injections.)

Release From Surfaces
indicates the surface from which the particles in a surface injection will be released. (This item will appear only for a surface injection.)
**Surface Name Pattern**
allows you to enter a string (optionally containing wildcard characters) for which matching surface names will be added to the current selection in **Release From Surfaces** when you click **Match**.

**Particle Type**
specifies the particle type as **Massless**, **Inert**, **Droplet**, **Combusting**, or **Multicomponent**. These types are described in **Particle Types** (p. 1159).

**Laws**
(not for massless particles) contains inputs for customized particle laws.

**Custom**
enables the specification of customized particle laws and opens the **Custom Laws Dialog Box** (p. 2443).

**Material**
(not for massless particles) indicates the material for the particles. If this is the first time you have created a particle of this type, you can choose from all of the materials by copying them from the database or creating them from scratch, as discussed in **Setting Discrete-Phase Physical Properties** (p. 1197) and described in detail in **Using the Materials Task Page** (p. 399).

**Diameter Distribution**
(not for massless particles) allows you to change from the default **linear** interpolation method used to determine the size of the particles in a **group** injection, or the default **uniform** method used to determine the size of the particles in a **surface** injection, to the **rosin-rammler** or **rosin-rammler-logarithmic** method. The Rosin-Rammler method for determining the range of diameters is described in **Using the Rosin-Rammler Diameter Distribution Method** (p. 1171).

**Evaporating Species**
(for **droplet** particles) specifies the gas-phase species created by the vaporization and boiling laws (laws 2 and 3).

**Devolatilizing Species**
(for **combusting** particles) specifies the gas-phase species created by the devolatilization law (law 4).

This item will not appear for two-mixture-fraction non-premixed combustion calculations.

**Devolatilizing Stream**
(for **combusting** particles) specifies the destination stream for the gas-phase species created by the devolatilization law (law 4).

This item will appear only for two-mixture-fraction non-premixed combustion calculations.

**Oxidizing Species**
(for **combusting** particles) specifies the gas phase species that participates in the surface char combustion reaction (law 5).

**Product Species**
(for **combusting** particles) specifies the gas-phase species created by the surface char combustion reaction (law 5).

This item will not appear for two-mixture-fraction non-premixed combustion calculations.

**Product Stream**
(for **combusting** particles) specifies the destination stream for the gas-phase species created by the surface char combustion reaction (law 5).
This item will appear only for two-mixture-fraction non-premixed combustion calculations.

**Discrete Phase Domain**
is available when using the **Dense Discrete Phase Model**, described in Including the Dense Discrete Phase Model (p. 1343).

**DEM Collision Partner**
is available when using the **DEM Collision** model, described in Modeling Collision Using the DEM Model (p. 1145).

**Point Properties**
displays the inputs for the point properties for the injection (for example, position, velocity, diameter, temperature, and mass flow rate). These inputs are described for each injection type in Point Properties for Single Injections (p. 1160) – Point Properties for Effervescent Atomizer Injections (p. 1170).

**First Point**
specifies the first point properties for the injection.

**Last Point**
specifies the last point properties for the injection.

**Physical Models**
displays the inputs for injection-specific physics models.

**Drag Parameters**
allows the setting of the drag law used in calculating the force balance on the particles. See Particle Force Balance in the Theory Guide for details on the items below.

**Drag Law**
is a drop-down list containing the available choices for the drag law:

- **spherical**
  assumes that the particles are smooth spheres.

- **nonspherical**
  assumes that the particles are not spheres, but are all identically shaped. The shape is specified by the **Shape Factor**.

- **Stokes-Cunningham**
is for use with sub-micron particles. A **Cunningham Correction** is added to Stokes’ drag law to determine the drag.

- **high-Mach-number**
is similar to the spherical law with corrections to account for a particle Mach number greater than 0.4 or a particle Reynolds number greater than 20.

- **dynamic-drag**
accounts for the effects of droplet distortion. This drag law is available only when one of the droplet breakup models is used in conjunction with unsteady tracking. See Dynamic Drag Model Theory in the Theory Guide for details.

**Shape Factor**
specifies the shape of the particles when **nonspherical** is selected as the **Drag Law** ($\phi$ in Equation 16.67 in the Theory Guide). It is the ratio of the surface area of a sphere having the
same volume as the particle to the actual surface area of the particle. The shape factor value cannot be greater than 1.

**Cunningham Correction**

\( C'_c \) in Equation 16.69 in the Theory Guide) is used with Stokes’ drag law to determine the force acting on the particles when the particles are sub-micron size. It appears when Stokes-Cunningham is selected as the Drag Law.

**Brownian Motion**

enables the incorporation of the effects of Brownian motion. See Brownian Force in the Theory Guide for details.

**Breakup**

contains parameters that control droplet breakup and collision. (This section of the dialog box appears only if Unsteady Tracking is enabled in the Discrete Phase Model Dialog Box (p. 1998).)

**Enable Breakup**

enables breakup for this injection.

**Breakup Model**

contains parameters that control droplet breakup. (This item appears only if Enable Breakup is selected.)

**TAB**

enables the Taylor Analogy Breakup (TAB) model, which is applicable to many engineering sprays. This method is based upon Taylor’s analogy between an oscillating and distorting droplet and a spring mass system. See Taylor Analogy Breakup (TAB) Model in the Theory Guide for details.

**Wave**

enables the Wave breakup model, which considers the breakup of the injected liquid to be induced by the relative velocity between the gas and liquid phases. See Wave Breakup Model for details.

**KHRT**

enables the Kelvin-Helmholtz Rayleigh-Taylor breakup model, which considers the two competing effects of aerodynamic breakup and instabilities due to droplet acceleration. See KHRT Breakup Model in the Theory Guide for details.

**SSD**

enables the stochastic secondary droplet breakup model, where the probability of breakup is independent of the parent droplet size and the secondary droplet size is sampled from an analytical solution of the Fokker-Planck equation for the probability distribution. See Stochastic Secondary Droplet (SSD) Model in the Theory Guide for details.

**Breakup Constants**

contains model constants used in the equations for spray breakup. (This item appears only if Enable Breakup is selected.)

**y₀**

(only for the TAB model) is the constant \( y₀ \) in Equation 16.268 in the Theory Guide.
**Breakup Parcels**
is the number of child parcels the droplet is split into, as described in *Velocity of Child Droplets* in the *Theory Guide*.

**B0**
(only for the Wave and KHRT models) is the constant $B_0$ in Equation 16.295 in the *Theory Guide*.

**B1**
(only for the Wave and KHRT models) is the constant $B_1$ in Equation 16.297 in the *Theory Guide*.

**Ctau**
(only for the KHRT model) is the constant $C_\tau$ in Equation 16.302 in the *Theory Guide*.

**CRT**
(only for the KHRT model) is the constant $C_{RT}$ in Equation 16.303 in the *Theory Guide*.

**CL**
(only for the KHRT model) is the constant $C_L$ in Equation 16.298 in the *Theory Guide*.

**Critical We**
(only for the SSD model) is the critical Weber number in Equation 16.304 in the *Theory Guide*.

**Core B1**
(only for the SSD model) is $B$ in Equation 16.305 in the *Theory Guide*.

**Target Np**
(only for the SSD model) is the average number in parcels for daughter parcels.

**Xi**
(only for the SSD model) is $\langle \xi \rangle$ in Equation 16.306 in the *Theory Guide*.

**Turbulent Dispersion**
displays the inputs for stochastic tracking and cloud tracking.

**Stochastic Tracking**
controls the stochastic tracking for turbulent flows. Stochastic tracking includes the effect of turbulent velocity fluctuations on the particle trajectories using the DRW model described in *Stochastic Tracking* in the *Theory Guide*. See *Stochastic Tracking (p. 1182)* for details about the items below.

**Discrete Random Walk Model**
includes the effect of instantaneous turbulent velocity formulations on the particle trajectories through stochastic method.

**Random Eddy Lifetime**
specifies that the characteristic lifetime of the eddy is to be random.

**Number of Tries**
controls the inclusion of turbulent velocity fluctuations.

An input of 1 or greater tells ANSYS Fluent to include turbulent velocity fluctuations in the particle force balance.
**Time Scale Constant**

is \( C_L \) in **Equation 16.16** in the **Theory Guide**. The default is 0.15; if you use the RSM, a value of 0.3 is recommended.

**Cloud Tracking**

incorporates the effects of turbulent dispersion on the injection. For details on the following items, see **Particle Cloud Tracking** in the **Theory Guide** and **Cloud Tracking** (p. 1184).

**Cloud Model**

enables particle cloud tracking.

**Min. Cloud Diameter**

specifies the diameter of the cloud in which the particles enter the domain.

**Max. Cloud Diameter**

specifies the maximum allowed cloud diameter.

**Parcel**

displays the inputs for controlling the discrete phase parcels.

**Parcel Definitions**

contains settings for how parcels are defined.

**Parcel Release Method**

specifies the method for releasing parcels. Available settings are **standard**, **constant-number**, **constant-mass**, and **constant-diameter**. See **Steady/Transient Treatment of Particles** (p. 1136) for details about these settings.

**Wet Combustion**

displays the inputs for the wet combustion model.

**Wet Combustion Model**

allows the combusting particles to include an evaporating/boiling material.

**Liquid Material**

contains a drop-down list of liquid materials that can be chosen as the evaporating/boiling material to be included with the combusting particles.

**Liquid Fraction**

sets the volume fraction of the liquid present in the particle.

**Components**

displays the inputs for **Multicomponent** for use in the definition of the particle injection. For details on the following items, see **Vapor Liquid Equilibrium Theory** in the **Theory Guide**.

**Multicomponent Settings**

contains the multicomponent injections.

**Component**

specifies the component that is a part of the multicomponent species.

**Mass Fraction**

specifies the mass fraction of the component in a multicomponent species.
**Evaporating Species**
specifies the gas-phase species to be evaporated.

**Evaporating Stream**
specifies the source stream from which the species will be evaporated.

**UDF**
displays the inputs for **User-Defined Functions** for use in the definition of the particle injection. For details about user-defined functions, see the separate **UDF Manual**.

**Initialization**
contains a drop-down list of available user-defined functions. The UDF that you choose will be used to modify the injection properties at the time the particles are injected into the domain.

**Heat/Mass Transfer**
allows you to select the UDF that defines the heat or mass transfer.

**Multiple Reactions**
displays the inputs for **Multiple Surface Reactions**. See **Particle Surface Reactions** (p. 924) for details about this model.

**Species Mass Fractions**
specify the combustible fraction of the combusting particle if you have defined more than one particle surface species. See **Using the Multiple Surface Reactions Model for Discrete-Phase Particle Combustion** (p. 925) for details.

**File...**
opens the **Select File Dialog Box** (p. 15), in which you can select a file containing the injection definition (when **file** is selected as the **Injection Type**).

### 36.3.13.3. Set Multiple Injection Properties Dialog Box

The **Set Multiple Injection Properties** dialog box allows you to set properties that are common to multiple injections. This dialog box is opened when you select more than one injections in the **Injections Dialog Box** (p. 2434). See **Defining Properties Common to More than One Injection** (p. 1185) for details about the items below.
Controls

Injections Setup
contains a list of the categories of injection properties that you can set for the injections in the Injections list. These categories correspond to the categories of inputs in the Set Injection Properties Dialog Box (p. 2436). When you select an item in the Injections Setup list, the dialog box will expand to show the relevant inputs, which are the same as those in the Set Injection Properties dialog box.

Injections
displays an informational list of the injections for which you are setting common properties. These are the injections that you selected in the Injections Dialog Box (p. 2434).

36.3.13.4. Custom Laws Dialog Box

The Custom Laws dialog box is used to incorporate user-defined functions (see the separate UDF Manual for details) in place of the default physical laws (1 through 6) used in the heat/mass transfer calculations.
Controls

**First Law, Second Law, Third Law, Fourth Law, Fifth Law, Sixth Law**
contain drop-down lists in which you can choose a user-defined particle law to replace the standard law.

**Switching**
contains a drop-down list in which you can select a user-defined function that customizes the way ANSYS Fluent switches between particle laws.

36.3.14. Define/DTRM Rays...

The **Define/DTRM Rays...** menu item opens the DTRM Rays Dialog Box (p. 2444).

36.3.14.1. DTRM Rays Dialog Box

The **DTRM Rays** dialog box allows you to define the rays used by the discrete transfer radiation model (DTRM). It opens automatically when you click **OK** after selecting the **Discrete Transfer** model in the Radiation Model Dialog Box (p. 1917). See Setting Up the DTRM (p. 780) for details about the items below.
Controls

Clustering
contains parameters for the clusters (see Clustering in the Theory Guide).

Cells Per Volume Cluster, Faces Per Surface Cluster
control the number of radiating surfaces and absorbing cells. (See the explanation in Controlling the Clusters (p. 781).)

Angular Discretization
contains parameters for the ray traces (see Ray Tracing in the Theory Guide).

Theta Divisions, Phi Divisions
control the number of rays being traced. (Guidelines are provided in Controlling the Rays (p. 781).)

Display Clusters
generates a graphical display of the clusters in the domain. (This item is available only after you have created or read a ray file.)

36.3.15. Define/Shell Conduction Manager...

The Define/Shell Conduction Manager... menu item opens the Shell Conduction Manager Dialog Box (p. 2445).

36.3.15.1. Shell Conduction Manager Dialog Box

The Shell Conduction Manager dialog box allows you to manage, define, and display shell conduction zones all in one location. See Managing Shell Conduction Walls (p. 772) for details about using the Shell Conduction Manager dialog box.
Controls

Select Zones
contains the list of **Shell Conduction Zones** and **Wall Zones**.

Shell Conduction Zones
contains a list of zones with shell conduction enabled.

Wall Zones
contains a list of zones without shell conduction.

> , <
disables and enables shell conduction for a selected zone, respectively.

Display Zones
displays the selected walls in the graphics window. Note that you can select walls with or without shell conduction. The zones will be displayed with different colors depending on the option selected in **Mesh Colors Dialog Box** (p. 1895) (accessible from the **Mesh Display Dialog Box** (p. 1891)).

Settings...
opens the **Shell Conduction Model Settings Dialog Box** (p. 2447), where you can define the shell properties of the walls selected in the **Shell Conduction Zones** list.

Shell Conduction Zone Name Pattern
specifies the pattern to look for in the names of shell conduction zones. Type the text, numbers, and wildcards (*) in the text field and click **Match** to select or deselect the zones in the **Shell Conduction Zones** list with names that match the specified pattern.

Read...
allows you to define your shell conduction settings by reading a CSV file.
Write... allows you to write your saved shell conduction settings to a CSV file.

### 36.3.15.2. Shell Conduction Model Settings Dialog Box

The **Shell Conduction Model Settings** dialog box allows you to define the shell conduction settings for either a single **Wall** dialog box or all of the walls selected in the **Shell Conduction Zones** list of the **Shell Conduction Manager Dialog Box** (p. 2445). See **Shell Conduction** (p. 323) and **Managing Shell Conduction Walls** (p. 772) for details about the items below.

![Shell Conduction Model Settings](image)

#### Controls

**Number of Layers**
- allows you to define the number of layers that make up the wall(s).

**Name**
- displays the name of each layer. Note that **layer-1** is the layer closest to the fluid / solid adjacent to the wall zone, and layers with higher numbers are further away.

**Thickness**
- sets the thickness of each layer for the calculation of the shell thermal resistance. Each layer must have a nonzero thickness.

**Material Name**
- sets the material type for each layer. The conductivity of the material is used for the calculation of shell thermal resistance. Materials are defined using the **Materials Task Page** (p. 2020).

**Heat Generation Rate**
- sets the rate of heat generation in each layer.

#### 36.3.16. Define/Custom Field Functions...

The **Define/Custom Field Functions...** menu item opens the **Custom Field Function Calculator Dialog Box** (p. 2448).
36.3.16.1. Custom Field Function Calculator Dialog Box

The Custom Field Function Calculator dialog box allows you to define custom field functions based on existing functions, using simple calculator operators. Any functions that you define will be added to the list of default flow variables and other field functions provided by ANSYS Fluent.

**Important**

Recall that you must enter all constants in the function definition in SI units.

See Creating a Custom Field Function (p. 1827) for details about the items below.

**Controls**

**Definition**

Displays the function that you are currently defining. As you select each item from the Field Functions list or the calculator keypad, it will appear in the Definition text entry box. You cannot edit the contents of this box directly; if you want to delete part of a function, use the Delete button on the keypad.

**Calculator Buttons**

Are push buttons that perform calculator operations. When you select a calculator button (by clicking on it), the appropriate symbol will appear in the Definition text entry box.

**Select Operand Field Functions from**

Contains the available field functions and the means for selecting them.

- **Field Functions**
  
  Contains a list from which you can select a variable to be used in the definition of a new function.

- **Select**
  
  Enters the variable that is currently selected in the Field Functions list in the Definition field.

**New Function Name**

Specifies the name of the function you are defining. Should you decide to change the function name after you have defined the function, you can do so in the Field Function Definitions Dialog Box (p. 2449), which you can open by clicking on the Manage... push button.
Define
creates the function and adds it to the list of Custom Field Functions within the drop-down list of available field functions. The Define push button is grayed out after you create a new function or if the Definition field is empty.

Manage...
opens the Field Function Definitions Dialog Box (p. 2449), which enables you to check, rename, save, load, and delete custom field functions.

36.3.16.2. Field Function Definitions Dialog Box

The Field Function Definitions dialog box allows you to check, rename, save, load, and delete custom field functions that you defined in the Custom Field Function Calculator Dialog Box (p. 2448). See Manipulating, Saving, and Loading Custom Field Functions (p. 1829) for details about the items below.

![Field Function Definitions Dialog Box]

Controls

Definition
displays the function selected in the Field Functions list. This display is for informational purposes only; you cannot edit it.

Field Functions
contains a selectable list of custom field functions. When you select a function, its definition will appear in the Definition box and its name will appear in the Name text entry box.

Name
displays the name of the currently selected field function. You can enter a new name in this box if you want to rename the function.

ID
reports the ID number of the selected function. The field function at the top of the list has an ID of 0, the second function has an ID of 1, and so on.

Rename
changes the name of the selected function to the name specified in the Name text entry box.
**Delete**
 deletes the selected field function.

**Save...**
 opens the The Select File Dialog Box (p. 15), where you can specify a file in which to save all of the functions in the Field Functions list.

**Load...**
 opens the Select File dialog box, where you can specify a file from which to read custom field functions (that is, a file that you saved using the Save... button above).

### 36.3.17. Define/Parameters...

The Define/Parameters... menu item opens the Parameters Dialog Box (p. 2367).

### 36.3.18. Define/Profiles...

The Define/Profiles... menu item opens the Profiles Dialog Box (p. 2098).

### 36.3.19. Define/Units...

The Define/Units... menu item opens the Set Units Dialog Box (p. 1894).

### 36.3.20. Define/User-Defined/Functions/Interpreted...

The Define/User-Defined/Functions/Interpreted... menu item opens the Interpreted UDFs Dialog Box (p. 2450).

#### 36.3.20.1. Interpreted UDFs Dialog Box

The Interpreted UDFs dialog box allows you to compile user-defined functions. See the separate UDF Manual for details.

<table>
<thead>
<tr>
<th>Controls</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Source File Name</strong></td>
</tr>
<tr>
<td>sets the name of your user-defined function.</td>
</tr>
</tbody>
</table>
**CPP Command Name**  
sets the name of your C preprocessor.

**Stack Size**  
sets the size of the stack. Keep the default **Stack Size** setting of 10000, unless the number of local variables in your function will cause the stack to overflow. In this case, set the **Stack Size** to a number that is greater than the number of local variables used.

**Display Assembly Listing**  
indicates whether or not to display a listing of assembly language code in your console window as the function compiles.

**Use Contributed CPP**  
specifies the use of the C preprocessor that ANSYS Fluent has supplied, instead of your own.

**Interpret**  
interprets the specified function.

### 36.3.21. Define/User-Defined/Functions/Compiled...

The **Define/User-Defined/Functions/Compiled...** menu item opens the **Compiled UDFs Dialog Box** (p. 2451).

#### 36.3.21.1. Compiled UDFs Dialog Box

The **Compiled UDFs** dialog box allows you to open a library of compiled user-defined functions. See the separate **UDF Manual** for details.

![Compiled UDFs Dialog Box](image)

**Controls**

**Source Files**  
contains a list of source files.

**Header Files**  
contains a list of header files.

**Add...**  
opens the **Select File** dialog box.
Delete
   deletes the selected file from the list.

Library Name
   specifies the name of the library to be created.

Build
   builds the library and compiles the UDF.

Load
   opens the specified library and loads the UDF.

36.3.22. Define/User-Defined/Functions/Manage...

The Define/User-Defined/Functions/Manage... menu item opens the UDF Library Manager Dialog Box (p. 2452).

36.3.22.1. UDF Library Manager Dialog Box

The UDF Library Manager dialog box allows you to load/unload the UDF libraries. See the separate UDF Manual for details.

Controls

UDF Libraries
   lists the UDF libraries that are loaded in ANSYS Fluent.

Library Name
   specifies the name of the library to be loaded/unloaded.

Load
   opens the specified library and loads the UDF.

Unload
   unloads the specified library.
36.3.23. Define/User-Defined/Function Hooks...

The Define/User-Defined/Function Hooks... menu item opens the User-Defined Function Hooks Dialog Box (p. 2453).

36.3.23.1. User-Defined Function Hooks Dialog Box

The User-Defined Function Hooks dialog box allows you to specify user-defined functions (UDFs) connected to a number of models and procedures in ANSYS Fluent. See the separate UDF Manual for details.

---

Important

You can hook multiple UDFs to the following functions:

- Controls
- Initialization
- Adjust
- Execute At End
- Read Case
- Write Case
- Read Data
- Write Data
- Execute at Exit
### Controls

#### Initialization
selects a UDF that is called immediately after you initialize your flow field.

#### Adjust
selects a UDF that is called at the beginning of an iteration before solution of velocities, pressure, and other quantities begins.

#### Execute At End
selects a UDF that is called at the end of an iteration or time step.

#### Read Case
selects a UDF that defines a customized section that is to be read from the case file.

#### Write Case
selects a UDF that defines a customized section that is to be written to the case file.

#### Read Data
selects a UDF that defines a customized section that is to be read from the data file.

#### Write Data
selects a UDF that defines a customized section that is to be written to the data file.

#### Execute at Exit
selects a UDF that is called when exiting an ANSYS Fluent session.
Wall Heat Flux
   selects a UDF that modifies the way that the solver computes the heat flux between a wall and the neighboring fluid cells.

Net Reaction Rate
   selects a UDF that defines the net reaction rate.

Volume Reaction Rate
   selects a UDF that defines a volumetric reaction rate.

Surface Reaction Rate
   selects a UDF that defines a surface reaction rate.

Particle Reaction Rate
   selects a UDF that defines a particle reaction rate.

Turbulent Premixed Source
   selects a UDF that defines the turbulent flame speed and source term for the premixed or partially pre-mixed combustion model.

Chemistry Step
   selects a UDF that defines the chemistry step function.

Spray Collide
   selects a UDF that defines the spray collide function.

Cavitation Mass Rate
   selects a UDF that defines the cavitation rate.

DO Source
   selects a UDF that defines the discrete ordinate source function.

DO Diffuse Reflectivity
   selects a UDF that defines the diffuse reflectivity function for the DO radiation model.

DO Specular Reflectivity
   selects a UDF that defines the specular reflectivity function for the DO radiation model.

Emissivity Weighting Factor
   selects a UDF that defines the emissivity weighting factor for the non-gray DO radiation model or the non-gray P-1 radiation model.

Thickened Flame Model Parameters
   selects a UDF that defines the parameters for the Thickened Flame Model.

36.3.24. Define/User-Defined/Execute on Demand...

The Define/User-Defined/Execute on Demand... menu item opens the Execute on Demand Dialog Box (p. 2455).

36.3.24.1. Execute on Demand Dialog Box

The Execute on Demand dialog box allows you to execute a specified user-defined function immediately. See the separate UDF Manual for details.
**Controls**

**Execute on Demand**
selects the UDF to be executed.

**Execute**
executes the selected function.

**36.3.25. Define/User-Defined/Scalars...**

The **Define/User-Defined/Scalars...** menu item opens the **User-Defined Scalars Dialog Box (p. 2456)**.

**36.3.25.1. User-Defined Scalars Dialog Box**

The **User-Defined Scalars** dialog box allows you to include user-defined scalar transport equations in your calculation. See **User-Defined Scalar (UDS) Transport Equations (p. 505)** for details.

**Controls**

**Number of User-Defined Scalars**
specifies how many additional scalar transport equations you would like to include in the calculation.

**Inlet Diffusion**
when enabled allows you to include the diffusion term in the UDS transport equation for all inflow and outflow boundaries.

**User-Defined Scalars Options**
contains settings that define the scalar transport equation.
UDS Index
when set to 0 marks the first user-defined scalar equation.

Solution Zones
specifies in which zone the scalar equation will be solved: all fluid zones, all solid zones, all zones (fluid and solid) or selected zones.

Flux Function
is a drop-down list containing available functions for the convection term of the user-defined scalar transport equation(s).

none
(the default) indicates that there is no convection term included in the scalar transport equation(s); that is, you want to solve a Poisson equation instead of a convection/diffusion equation.

mass flow rate
indicates that the convection term in the scalar transport equation(s) is equal to the mass flow rate \( \rho \vec{v} \cdot \vec{A} \).

Note that the none and mass flow rate options will apply to all solved user-defined scalars. A user-defined flux function must be supplied if a different convective flux is desired for each user-defined scalar.

Unsteady Function
is a drop-down list containing available functions for the unsteady term of the user-defined scalar transport equation(s).

36.3.26. Define/User-Defined/Memory...
The Define/User-Defined/Memory... menu item opens the User-Defined Memory Dialog Box (p. 2457).

36.3.26.1. User-Defined Memory Dialog Box
The User-Defined Memory dialog box allows you to allocate memory for user-defined storage variables. See the separate UDF Manual for details.

Controls

Number of User-Defined Memory Locations
specifies the number of memory locations to be allocated.
Number of User-Defined Node Memory Locations

specifies the number of node memory locations to be allocated.

Important

For postprocessing User-Defined Memory in CFD-Post, the ANSYS Fluent user must select the UDM quantities using the Data File Quantities option and subsequently write the data file to postprocess the quantities in ANSYS Fluent. Alternatively, you have the option of exporting the desired quantities to a .cdat file. This will ensure that all the UDM quantities are available for postprocessing in CFD-Post. Refer to the ANSYS CFD-Post manual for more information.

36.3.27. Define/User-Defined/Fan Model...

The Define/User-Defined/Fan Model... menu item opens the User-Defined Fan Model Dialog Box (p. 2458).

36.3.27.1. User-Defined Fan Model Dialog Box

The User-Defined Fan Model dialog box allows you to periodically regenerate a profile file that can be used to specify the characteristics of a fan, including pressure jump across the fan, and radial and swirling components of velocity generated by the fan. See User-Defined Fan Model (p. 370) for details about this feature and how to use this dialog box.

Controls

Fan Zones
contains a list from which you can select the fan zone(s) on which your executable will operate.

Iteration Update Interval
specifies how often the executable will be called on to update the fan profile file.

Output Profile Points
specifies the number of points in the profile file to be written by ANSYS Fluent.
**External Command Name**

specifies the name of the executable.

36.3.28. Define/User-Defined/1D Coupling...

The **Define/User-Defined/1D Coupling...** menu item opens the 1D Simulation Library Dialog Box (p. 2459).

**36.3.28.1. 1D Simulation Library Dialog Box**

The **1D Simulation Library** dialog box allows you to set parameters related to coupling between ANSYS Fluent and GT-Power or WAVE. See **Coupling Boundary Conditions with GT-Power** (p. 391) or **Coupling Boundary Conditions with WAVE** (p. 393) for details about the items below.

![1D Simulation Library Dialog Box](image)

**Controls**

**1D Library**

specifies the type of library to be used. (Currently only **GTpower** and **WAVE** are available.)

**1D Input File Name**

specifies the name of the GT-Power or WAVE input file.

**Start**

starts up GT-Power or WAVE and generates ANSYS Fluent user-defined functions for each boundary in the input file.

**Stop**

unlinks the shared library.

36.4. Solve Menu

For additional information, see the following sections:

36.4.1. Solve/Methods...

36.4.2. Solve/Controls...

36.4.3. Solve/Monitors...

36.4.4. Solve/Initialization...

36.4.5. Solve/Calculation Activities...

36.4.6. Solve/Run Calculation....

**36.4.1. Solve/Methods...**

The **Solve/Methods...** menu item opens the **Solution Methods Task Page** (p. 2204).
36.4.2. Solve/Controls...

The Solve/Controls... menu item opens the Solution Controls Task Page (p. 2208).

36.4.3. Solve/Monitors...

The Solve/Monitors... menu item opens the Monitors Task Page (p. 2220).

36.4.4. Solve/Initialization...

The Solve/Initialization... menu item opens the Solution Initialization Task Page (p. 2249).

36.4.5. Solve/Calculation Activities...

The Solve/Calculation Activities... menu item opens the Calculation Activities Task Page (p. 2254).

36.4.6. Solve/Run Calculation....

The Solve/Run Calculation... menu item opens the Run Calculation Task Page (p. 2269).

36.5. Adapt Menu

For additional information, see the following sections:

  36.5.1. Adapt/Boundary...
  36.5.2. Adapt/Gradient...
  36.5.3. Adapt/Iso-Value...
  36.5.4. Adapt/Region...
  36.5.5. Adapt/Volume...
  36.5.6. Adapt/Yplus/Ystar...
  36.5.7. Adapt/Anisotropic...
  36.5.8. Adapt/Manage...
  36.5.9. Adapt/Controls...
  36.5.10. Adapt/Geometry...
  36.5.11. Adapt/Display Options...
  36.5.12. Adapt/Smooth/Swap...

36.5.1. Adapt/Boundary...

The Adapt/Boundary... menu item opens the Boundary Adaption Dialog Box (p. 2460)

36.5.1.1. Boundary Adaption Dialog Box

The Boundary Adaption dialog box allows you to mark or refine boundary cells on selected boundary zones. See Boundary Adaption (p. 1549) for details.
Controls

Options contains three different methods for boundary adaption:

Cell Distance enables adaption based on a cell’s distance from the boundary, measured in number of cells. See Boundary Adaption Based on Number of Cells (p. 1549) for details.

Normal Distance enables adaption based on a cell’s normal distance from the boundary. See Boundary Adaption Based on Normal Distance (p. 1550) for details.

Volume Distance enables adaption based on a target boundary volume and growth factor. See Boundary Adaption Based on Target Boundary Volume (p. 1551) for details.

Contours... opens the Contours Dialog Box (p. 2283), which you can use to determine the appropriate parameters for the boundary adaption.

Manage... opens the Manage Adaption Registers Dialog Box (p. 2472), which allows you to display and manipulate adaption registers that are generated using the Mark command.

Controls... opens the Mesh Adaption Controls Dialog Box (p. 2474), which allows you to control certain aspects of the adaption process.

Number of Cells sets the maximum boundary cell distance for adaption (used with the Cell Distance option).

Distance Threshold sets the maximum normal distance for adaption (used with the Normal Distance option).

Boundary Volume sets the boundary volume \( V_{boundary} \) in Equation 29.1 (p. 1551) (used with the Volume Distance option).
Growth Factor
sets the exponential growth factor $\alpha$ in Equation 29.1 (p. 1551) (used with the Volume Distance option).

Boundary Zones
contains a selectable list of zones on which you can refine. The boundary cells associated with the zones that you select will be refined.

Adapt
refines the cells with edges/faces on the zones selected in the Boundary Zones list.

Mark
marks the boundary cells associated with the zones selected in the Boundary Zones list for refinement. This command produces an adaption register. For information on using adaption registers, see Manipulating Adaption Registers (p. 1564).

36.5.2. Adapt/Gradient...
The Adapt/Gradient... menu item opens the Gradient Adaption Dialog Box (p. 2462).

36.5.2.1. Gradient Adaption Dialog Box
The Gradient Adaption dialog box allows you to mark or adapt to gradients of a specified field variable. See Gradient Adaption (p. 1552) for details.

Controls
Options
contains the check buttons that toggle the ability to mark and/or adapt cells for refinement or coarsening.

Refine
toggles the ability to refine or mark cells for refinement.
Coarsen
toggles the ability to coarsen or mark cells for coarsening (available in 2D and axisymmetric cases).

Normalize per Zone
toggles the ability of zonal normalization.

Contours...
opens the Contours Dialog Box (p. 2283), which you can use as an aid to selecting adaption thresholds by displaying contours of adaption function.

Manage...
opens the Manage Adaption Registers Dialog Box (p. 2472), which allows you to display and manipulate adaption registers that are generated using the Mark command.

Controls...
opens the Mesh Adaption Controls Dialog Box (p. 2474), which allows you to control certain aspects of the adaption process.

Method
contains options for specifying the criterion for adaption.

Curvature
specifies the use of the second gradient of a field variable for adaption. This approach is recommended for problems with smooth solutions.

Gradient
specifies the use of the first gradient of a field variable for adaption. This approach is recommended for problems with strong shocks.

Iso-Value
allows you to customize the adaption criterion (using custom field functions, user-defined scalars, and so on).

Normalization
contains the options available for normalization.

Standard
specifies that the gradient or curvature is not normalized.

Scale
specifies that the gradient or curvature is scaled by its average value in the domain.

Normalize
specifies that the gradient or curvature is scaled by its maximum value in the domain (that is, the gradient or curvature is bounded by [0, 1]).

Dynamic
contains options to specify dynamic gradient adaption.

Dynamic
enables dynamic gradient adaption.
Interval
allows you to specify the number of iterations or time-steps between two consecutive automatic mesh adaptions, depending on whether you are performing a steady-state or a time-dependent solution, and on which solver you are using.

Gradients of
contains a list of the field variables that can be used in the gradient adaption function.

Min/Max
displays the minimum and maximum cell values of the gradient adaption function based on the selected quantity.

Coarsen Threshold
designates the threshold values for coarsening the mesh. Cells with adaption function values below the Coarsen Threshold will be marked for coarsening.

Refine Threshold
designates the threshold values for refining the mesh. Cells with adaption function values above the Refine Threshold will be marked for refinement.

Adapt
adapts the mesh based on the gradients of the selected scalar quantity, the coarsening and refining toggle buttons and thresholds, and the adaption limits.

Mark
marks cells to be refined and/or coarsened based on the gradients of the selected quantity and the coarsening and refining toggle buttons and thresholds. This command produces an adaption register. For information on using adaption registers, see Manipulating Adaption Registers (p. 1564).

Compute
computes the minimum and maximum cell values of the gradient adaption function with the selected scalar quantity. The values are displayed in the Min and Max real number fields.

36.5.3. Adapt/Iso-Value...
The Adapt/Iso-Value... menu item opens the Iso-Value Adaption Dialog Box (p. 2464).

36.5.3.1. Iso-Value Adaption Dialog Box
The Iso-Value Adaption dialog box allows you to mark or refine cells inside or outside a specified range of a selected scalar function. See Isovalue Adaption (p. 1555) for details.
### Controls

**Options**
contains radio buttons that control whether the cells inside or outside the isovalue range are marked for refinement.

- **Inside** enables the marking of cells with values between Iso-Min and Iso-Max.
- **Outside** enables the marking of cells with values less than Iso-Min or greater than Iso-Max.

**Iso-Values of**
contains a list from which you can select the solution variable to be used in the isovalue adaption function.

**Min/Max**
displays the minimum and maximum cell values of the selected field variable. The real number field values are not editable; they are purely informational.

- **Iso-Min** defines the minimum isovalue threshold.
- **Iso-Max** defines the maximum isovalue threshold.

**Manage...**
opens the Manage Adaption Registers Dialog Box (p. 2472), which allows you to display and manipulate adaption registers that are generated using the Mark command.

**Controls...**
opens the Mesh Adaption Controls Dialog Box (p. 2474), which allows you to control certain aspects of the adaption process.

**Adapt**
adapts the mesh based on the isovalues of the selected solution variable, the isovalue ranges, and the Inside/Outside option.
Mark
marks cells to be refined based on the isovalues of the selected quantity, the iso value ranges, and the
Inside/Outside option. This command produces an adaption register. For information on using adaption
registers, see Manipulating Adaption Registers (p. 1564).

Compute
computes the minimum and maximum cell values of the selected solution variable and displays them in the Min and Max real number fields.

36.5.4. Adapt/Region...
The Adapt/Region... menu item opens the Region Adaption Dialog Box (p. 2466).

36.5.4.1. Region Adaption Dialog Box
The Region Adaption dialog box allows you to mark or refine cells inside or outside a specified region
defined by text or mouse input. See Region Adaption (p. 1556) for details.

Controls

Options
contains radio buttons that control whether the cells inside or outside the region are marked for refine-
ment.

Inside
enables the marking of cells with centroids that are within the region.

Outside
enables the marking of cells with centroids that are outside the region.

Shapes
contains radio buttons that control the type of region.
**Hex/Quad**
defines a hexahedral region in 3D or a rectangular region in 2D. The appropriate button will appear for the solver you are using.

**Sphere/Circle**
defines a spherical region in 3D or a circular region in 2D. The appropriate button will appear for the solver you are using.

**Cylinder**
defines a cylindrical region in 3D or a rectangular region in 2D.

**Manage...**
opens the Manage Adaption Registers Dialog Box (p. 2472), which allows you to display and manipulate adaption registers that are generated using the Mark command.

**Controls...**
opens the Mesh Adaption Controls Dialog Box (p. 2474), which allows you to control certain aspects of the adaption process.

**Input Coordinates**
defines the extent of the selected region. The appearance of this box changes depending on the type of region selected.

If the region selected is a hexahedron or quadrilateral, you will input the minimum and maximum coordinates defining the box. (The Radius real number field will not be active.)

- **X Min, Y Min, Z Min**
define the coordinates of the minimum point defining the hexahedron or rectangle. For quadrilaterals, the Z Min real entry field will not be active.

- **X Max, Y Max, Z Max**
define the coordinates of the maximum point defining the hexahedron or rectangle. For quadrilaterals, the Z Max real entry field will not be active.

If the region selected is a sphere or circle, you will input the coordinates of the sphere’s center and its radius. (The maximum coordinate real number fields will not be active.)

- **X Center, Y Center, Z Center**
are the coordinates of the centroid of the sphere or circle. For circles, the Z Center real entry field will not be active.

- **Radius**
is the radius of the sphere or circle.

If the region selected is a cylinder, you will input the minimum and maximum coordinates defining the cylinder axis, as well as the radius of the cylinder.

- **X-Axis Min, Y-Axis Min, Z-Axis Min**
define the coordinates of the minimum point defining the cylinder axis. For 2D cases, the Z-Axis Min real entry field will not be active.

- **X-Axis Max, Y-Axis Max, Z-Axis Max**
define the coordinates of the maximum point defining the cylinder axis. For 2D cases, the Z-Axis Max real entry field will not be active.
Radius

is the radius of the cylinder. (In 2D, this will be the width of the resulting rectangle.)

Select Points with Mouse

activates selection of input coordinates with the mouse. If one of the mouse buttons is defined as a mouse probe, you may select the input coordinates from a display of the mesh or solution field. For more information on mouse buttons, refer to Controlling the Mouse Button Functions (p. 1654). After you select the points, the values will be loaded automatically into the appropriate real number field. If you desire, you can edit these values before marking or adapting. The order of input for defining a hexahedron (rectangle) is insignificant, but the order of input for the sphere (circle) has significance. First, you select the location of the centroid. Then you select a point that lies on the sphere, that is, a point that is one radius away from the centroid.

Adapt

adapts the mesh based on the region defined and the in/out option.

Mark

marks the cells to be refined based on the region defined and the in/out option. This command produces an adaption register. For information on using adaption registers, see Manipulating Adaption Registers (p. 1564).

36.5.5. Adapt/Volume...

The Adapt/Volume... menu item opens the Volume Adaption Dialog Box (p. 2468).

36.5.5.1. Volume Adaption Dialog Box

The Volume Adaption dialog box allows you to mark or refine cells based on cell volume or change in cell volume. See Volume Adaption (p. 1558) for details.

Controls

Options

contains the radio buttons that toggle between marking and/or refining based on volume magnitude or volume change.

Magnitude

enables the marking/refining of cells based on volume magnitude.

Change

enables the marking/refining of cells based on the change in volume.
Min

displays the minimum value of cell volume or cell volume change in the mesh. This value is not editable.

Max

displays the maximum value of cell volume or cell volume change in the mesh. This value is not editable.

Max Volume

defines the threshold value for marking/refining the mesh based on volume magnitude. Cells that have volumes greater than the threshold are marked for refinement.

Max Volume Change

defines the threshold value for marking/refining the mesh based on the change in volume. Cells with volume changes that are greater than the threshold value are marked for refinement.

Manage...

opens the Manage Adaption Registers Dialog Box (p. 2472), which allows you to display and manipulate adaption registers that are generated using the Mark command.

Controls...

opens the Mesh Adaption Controls Dialog Box (p. 2474), which allows you to control certain aspects of the adaption process.

Adapt

refines the mesh based on either the maximum volume or the volume change, and the adaption limits.

Mark

marks cells to be refined based on either the maximum volume or the volume change. This command produces an adaption register. For information on using adaption registers, see Manipulating Adaption Registers (p. 1564).

Compute

calculates the minimum and maximum cell volume or cell volume change and displays them in the Min and Max real number fields.

36.5.6. Adapt/Yplus/Ystar...

The Adapt/Yplus/Ystar... menu item opens the Yplus/Ystar Adaption Dialog Box (p. 2469).

36.5.6.1. Yplus/Ystar Adaption Dialog Box

The Yplus/Ystar Adaption dialog box allows you to mark or adapt boundary cells on specified wall zones based on the non-dimensional $y^+$ or $y^*$ parameter. See Yplus/Ystar Adaption (p. 1559) for details.
Controls

Options
contains the check buttons that toggle the ability to mark and/or adapt cells for refinement or coarsening.

Refine
toggles the ability to refine cells or mark cells for refinement.

Coarsen
toggles the ability to coarsen cells or mark cells for coarsening.

Type
contains the check buttons that enable adaption based on $y^+$ or $y^*$.

Yplus
enables $y^+$ adaption.

Ystar
enables $y^*$ adaption.

Wall Zones
contains a selectable list of active wall zones. Boundary cells associated with the wall zones you select will be marked or adapted based on the options, thresholds, and limitations applied in the dialog box.

Min/Max
displays the minimum and maximum cell values of $y^+$ or $y^*$ for all cells associated with viscous wall zones. Note that these values are independent of the wall zones selected. The real number field values are not editable; they are purely informational.

Min Allowed
designates the threshold value for coarsening the mesh. Cells with $y^+$ or $y^*$ values below the minimum threshold will be marked for coarsening.
**Max Allowed**

designates the threshold value for refining the mesh. Cells with \( y^+ \) or \( y^* \) values above the maximum threshold will be marked for refinement.

**Manage...**

opens the *Manage Adaption Registers Dialog Box (p. 2472)*, which allows you to display and manipulate adaption registers that are generated using the *Mark* command.

**Controls...**

opens the *Mesh Adaption Controls Dialog Box (p. 2474)*, which allows you to control certain aspects of the adaption process.

**Adapt**

adapts the mesh based the coarsening and refining toggle buttons, the wall zones selected, the minimum and maximum \( y^+ \) or \( y^* \) allowed, and the adaption limits.

**Mark**

marks cells to be refined and/or coarsened based on the wall zones selected and the minimum and maximum \( y^+ \) or \( y^* \) allowed in the mesh. This command produces an adaption register. For information on using adaption registers, see *Manipulating Adaption Registers (p. 1564)*.

**Compute**

computes the minimum and maximum values of \( y^+ \) or \( y^* \) on all cells on viscous walls and displays them in the *Min* and *Max* real number fields. Note that these are the extremes for the \( y^+ \) or \( y^* \) values of every cell on a viscous wall, not just the cells associated with the selected zones.

### 36.5.7. Adapt/Anisotropic...

The *Adapt/Anisotropic...* menu item opens the *Anisotropic Adaption Dialog Box (p. 2471)*.

#### 36.5.7.1. Anisotropic Adaption Dialog Box

The *Anisotropic Adaption* dialog box allows you to perform anisotropic adaption for certain cell types. See *Anisotropic Adaption (p. 1560)* for details.
Controls

**Cell Options**  
controls the marking of boundary layer cells.

- **Cell Distance**  
  indicates adaption using the distance of the marked cell to the boundary zone.

- **Register**  
  indicates adaption using an existing register.

**Splitting Options**  
control how the splitting ratio is computed.

- **Automatic**  
  allows the ratio to be computed automatically from the mesh.

- **Manual**  
  allows you to enter a specific value for the ratio in the **Split Ratio** field.

**Number of Cells**  
indicates the number of cells to be adapted and marked (available only when the **Cell Distance** option is enabled).

**Split Ratio**  
allows you to specify a value for the split ratio (available only when the **Manual** splitting option is enabled).

**Registers**  
provides a list of existing registers (available only when the **Register** option is enabled).

**Boundary Zones**  
contains a list of available boundary zones.

**Refine**  
refines the marked cells.

### 36.5.8. Adapt/Manage...

The **Adapt/Manage...** menu item opens the **Manage Adaption Registers Dialog Box (p. 2472)**.

### 36.5.8.1. Manage Adaption Registers Dialog Box

The **Manage Adaption Registers** dialog box provides an interactive mechanism for creating, destroying, and displaying functions for mesh adaption. See **Manipulating Adaption Registers (p. 1564)** for details about using the items in this dialog box.
Controls

Register Actions
contains operations applied to adaption or mask registers.

Change Type
toggles the register between adaption and mask types. Adaption registers are used to initiate refining or coarsening of the mesh. Typically, mask registers are combined with adaption registers to control the scope of the adaption process.

Combine
combines the selected adaption registers to create a hybrid adaption function. In some instances, three new registers may be created: a combination of the adaption registers, a combination of the mask registers, and then a combination of the two combined registers.

Delete
permanently discards the selected registers.

Mark Actions
contains operations applied to the cell markings defined in an adaption or mask register.

Exchange
modifies the cell markings in the following manner: all cells originally marked for refinement are marked for coarsening, and all cells originally marked for coarsening are marked for refinement.

Invert
modifies all the cell markings in a mask register in the following manner: all cells that were originally marked as ACTIVE are marked INACTIVE, and all cells originally marked as INACTIVE are marked ACTIVE. Note that this action can only be applied to mask registers.

Limit
applies the adaption volume limits to the selected registers. For information on adaption limits, see Mesh Adaption Controls (p. 1569).
Fill
marks for coarsening all cells in the adaption register that are not marked for refinement.

Registers
contains a list from which you can select the current adaption and mask registers. Many of the actions in the dialog box are activated or deactivated based on the number and/or type of adaption registers selected.

Register Info
provides the name, ID, number of cells marked for refinement and coarsening, and the type of the most recently selected or deselected register.

Options...
opens the Adaption Display Options Dialog Box (p. 2478).

Controls...
opens the Mesh Adaption Controls Dialog Box (p. 2474), which allows you to control certain aspects of the adaption process.

Adapt
adapts the mesh based on the selected adaption register. The Adapt button is deactivated if more than one adaption register is selected. Adaption functions composed of combinations of adaption registers can be produced using commands in the Register Actions and Mark Actions boxes.

Display
displays the cells marked for adaption in the selected adaption register in the active graphics window. The Display button is deactivated if more than one adaption register is selected. Adaption functions composed of combinations of adaption registers can be produced using commands in the Register Actions and Mark Actions boxes.

36.5.9. Adapt/Controls...
The Adapt/Controls... menu item opens the Mesh Adaption Controls Dialog Box (p. 2474).

36.5.9.1. Mesh Adaption Controls Dialog Box
The Mesh Adaption Controls dialog box allows you to set limits on the minimum cell size, the minimum and maximum number of cells, and the cell types that can be adapted. In addition, it allows you to vary the volume weighting of the gradient adaption function. See Mesh Adaption Controls (p. 1569) for details about the items below.
Controls

Options contains check buttons that control the manner in which the mesh can be adapted.

- **Refine**
  - toggles mesh adaption by adding points.

- **Coarsen**
  - toggles mesh adaption by removing points.

Zones contains a list of cell zones from which you can select the zones in which to perform adaption (or marking). By default, all cell zones are selected.

Min Cell Volume restricts the size of the cell that is considered for refinement. Even if the cell is marked for refinement, it will not be refined if its cell volume is less than this threshold value.

Min # of Cells specifies the minimum number of cells required in the mesh.

---

**Note**

When using the parallel solver, the **Min # of Cells** value is not strictly obeyed, but provides an approximate limit to the minimum cell count that the adaption algorithm will allow.
Max # of Cells
limits the total number of cells allowed in the mesh. A value of zero places no limits on the number of cells.

Note
When using the parallel solver, the Max # of Cells value is not strictly obeyed, but provides an approximate limit to the maximum cell count that the adaption algorithm will allow.

Max Level of Refine
specifies the maximum level of refinement for the cells.

Volume Weight
controls the volume weighting in the gradient adaption function. Valid values are between 0 and 1: 0 for no volume weighting and 1 for full volume weighting.

36.5.10. Adapt/Geometry...
The Adapt/Geometry... menu item opens the Geometry Based Adaption Dialog Box (p. 2476).

36.5.10.1. Geometry Based Adaption Dialog Box
The Geometry Based Adaption dialog box allows you to reconstruct the geometry while performing boundary adaption. See Geometry-Based Adaption (p. 1562) for details.

Controls
Reconstruct Geometry
enables geometry based adaption parameters.

Surface Meshes...
opens the Surface Meshes Dialog Box (p. 2477).
Wall Zones
allows you to select the wall zones you want to adapt.

Set...
opens the Geometry Based Adaption Controls Dialog Box (p. 2477).

36.5.10.2. Surface Meshes Dialog Box
The Surface Meshes dialog box allows you to read the surface meshes in ANSYS Fluent (See Reading Surface Mesh Files (p. 147) for details on reading surface meshes.)

Controls

Surfaces
contains a list of the surfaces available in the surface mesh you read.

You can select/deselect the surfaces listed under Surfaces.

Read...
opens the Select File dialog box in which you can select the surface mesh you want to read.

Delete
allows you to delete the selected surfaces under Surfaces area.

Display
allows you to display the selected surfaces under Surfaces.

36.5.10.3. Geometry Based Adaption Controls Dialog Box
The Geometry Based Adaption Controls dialog box allows you to set projections. It is opened from the Geometry Based Adaption Dialog Box (p. 2476). See Performing Geometry-Based Adeption (p. 1562) for details about the items below.
Controls

contains parameters to define geometry based adaption.

Disable Geometry Based Adaption for this Zone
disables the geometry reconstruction for selected zones in the domain.

Levels of Projection Propagation
is the number of layers of the nodes you want to project.

Direction of Projection
allows you to specify the direction in which you want to project the nodes.

Background Mesh
allows you to load the surface mesh as a background mesh for adaption.

36.5.11. Adapt/Display Options...

The Adapt/Display Options... menu item opens the Adaptation Display Options Dialog Box (p. 2478).

36.5.11.1. Adaptation Display Options Dialog Box

The Adaptation Display Options dialog box allows you to customize the display of adaption or mask registers. See Adaptation Display Options (p. 1568) for details about the items below.
Controls

Options contains check buttons that control the drawing of the mesh and the type of graphical tool used to display flagged cells.

Draw Mesh toggles the ability to draw the mesh with the adaption display. This command opens the Mesh Display Dialog Box (p. 1891), which allows you to select the desired surface or zone meshes to be displayed with the markings.

Filled toggles the solid shading of the cell wireframe.

Refine contains options related to the display of cells marked for refinement.

Wireframe toggles the display of the cell wireframe for cells flagged for refinement.

Marker toggles the display of the cell marker for cells flagged for refinement.

Color is a drop-down list of colors for the wireframe or marker for the cells marked for refinement.

Size is a real number entry for the size of the refine cell marker. A symbol of size 1.0 is 3.0% of the height of the display screen.

Symbol is a drop-down list of symbols that can be used for the refine cell marker.

Coarsen contains options related to the display of cells marked for refinement.

Wireframe toggles the display of the cell wireframe for cells flagged for coarsening.
Marker
toggles the display of the cell marker for cells flagged for coarsening.

Color
is a drop-down list of colors for the wireframe or marker for the cells marked for coarsening.

Size
is a real number entry for the size of the coarsen cell marker. A symbol of size 1.0 is 3.0% of the height of the display screen.

Symbol
is a drop-down list of symbols that can be used for the coarsen cell marker.

36.5.12. Adapt/Smooth/Swap...

The Adapt/Smooth/Swap... menu item opens the Smooth/Swap Mesh Dialog Box (p. 2480).

36.5.12.1. Smooth/Swap Mesh Dialog Box

The Smooth/Swap Mesh dialog box controls smoothing and face swapping of the numerical mesh. See Improving the Mesh by Smoothing and Swapping (p. 1572) for details about the items below.

Controls

Smooth
contains parameters associated with smoothing the mesh.

Method
indicates whether the quality-based, Laplacian, or the skewness-based smoothing method is to be used. Select quality based, laplace, or skewness from the drop-down list. Note that only the quality based item is available for parallel cases.

Percentage of Cells
(for quality-based smoothing) sets the percentage of the total cells on which improvements are attempted. Note that the cells selected for improvement are in the areas of the mesh that exhibit the lowest orthogonal quality. This field appears when quality based is selected as the smoothing method.
Relaxation Factor
(for Laplacian smoothing) sets the factor by which to multiply the computed position increment for the node. The lower the factor, the more reduction in node movement. This field appears when laplace is selected as the smoothing method.

Skewness Threshold
(for skewness-based smoothing) sets the minimum cell skewness value for which node smoothing will be attempted. ANSYS Fluent will try to move interior nodes to improve the skewness of cells with skewness greater than this value. By default, Skewness Threshold is set to 0.8 for 3D or 0.4 for 2D. The Skewness Threshold field appears when skewness is selected as the smoothing method.

Number of Iterations
defines the number of successive smoothing sweeps performed on the mesh.

Swap Info
provides information on the most recent face-swapping operation. This group box is only available for serial cases.

Number Swapped
displays the number of faces that were swapped based on the Delaunay circle test.

Number Visited
displays the total number of faces that were visited and tested for possible face swapping.

Smooth
initiates the desired number of smoothing iterations.

Swap
exchanges the faces of cells for which the circle test is not satisfied.

36.6. Surface Menu

For additional information, see the following sections:

36.6.1. Surface/Zone...
36.6.2. Surface/Partition...
36.6.3. Surface/Point...
36.6.4. Surface/Line/Rake...
36.6.5. Surface/Plane...
36.6.6. Surface/Quadric...
36.6.7. Surface/Iso-Surface...
36.6.8. Surface/Iso-Clip...
36.6.9. Surface/Transform...
36.6.10. Surface/Manage...

36.6.1. Surface/Zone...

The Surface/Zone... menu item opens the Zone Surface Dialog Box (p. 2481).

36.6.1.1. Zone Surface Dialog Box

The Zone Surface dialog box allows you to interactively create surfaces from face and cell zones in the domain. See Zone Surfaces (p. 1580) for details about the items below.
Controls

Zone
contains a list from which you can select the face or cell zone to be used for creating a zone surface.

Surfaces
displays an informational list of existing surfaces.

New Surface Name
designates the name of the surface to be created. The default is the zone name.

Create
creates the surface.

Manage...
opens the Surfaces Dialog Box (p. 2248) in which you can rename and delete surfaces and determine their sizes.

36.6.2. Surface/Partition...

The Surface/Partition... menu item opens the Partition Surface Dialog Box (p. 2482).

36.6.2.1. Partition Surface Dialog Box

The Partition Surface dialog box allows you to create a surface defined by the boundary of two adjacent mesh partitions. See Partition Surfaces (p. 1581) for details about the items below.
Controls

Options
contains check buttons that allow you to choose interior or exterior faces or cells to be contained in the partition surface.

Cells
specifies, when enabled, that the partition surface will consist of cells (either interior or exterior, depending on the status of the Interior check button) that lie on the partition boundary. When this option is disabled, the faces on the boundary between partitions will make up the partition surface. Depending on the status of the Interior check button, the faces will reflect data values for the interior or exterior cells.

Interior
toggles between interior and exterior cells. If the partition surface consists of faces instead of cells, Interior specifies for which cells data will be displayed on the faces. When this option is enabled, interior cells (cells that are on the Int Part side of the partition boundary) will make up the partition surface. When it is disabled, the partition surface will consist of exterior cells (cells that are on the Ext Part side of the partition boundary).

Partitions
contains information about which partitions are under consideration. The boundary that defines the partition surface is the boundary between the Int Part and the Ext Part. If there are more than two mesh partitions, each interior partition will share boundaries with several exterior partitions. By setting the appropriate values for Int Part and Ext Part, you can create surfaces for any of these boundaries.

Min/Max
indicates the minimum and maximum ID numbers of the mesh partitions. The minimum is always zero, and the maximum is one less than the number of processors.

Int Part
indicates the ID number of the interior partition (that is, the partition under consideration).

Ext Part
indicates the ID number of the bordering partition.

Surfaces
displays an informational list of existing surfaces.
**New Surface Name**

designates the name of the new surface. The default is the concatenation of the surface type and an integer which is the new surface ID.

**Create**
creates the surface.

**Manage...**
opens the Surfaces Dialog Box (p. 2248) in which you can rename and delete surfaces and determine their sizes.

### 36.6.3. Surface/Point...

The Surface/Point... menu item opens the Point Surface Dialog Box (p. 2239).

### 36.6.4. Surface/Line/Rake...

The Surface/Line/Rake... menu item opens the Line/Rake Surface Dialog Box (p. 2240).

### 36.6.5. Surface/Plane...

The Surface/Plane... menu item opens the Plane Surface Dialog Box (p. 2241).

### 36.6.6. Surface/Quadric...

The Surface/Quadric... menu item opens the Quadric Surface Dialog Box (p. 2243).

### 36.6.7. Surface/Iso-Surface...

The Surface/Iso-Surface... menu item opens the Iso-Surface Dialog Box (p. 2245).

### 36.6.8. Surface/Iso-Clip...

The Surface/Iso-Clip... menu item opens the Iso-Clip Dialog Box (p. 2246).

### 36.6.9. Surface/Transform...

The Surface/Transform... menu item opens the Transform Surface Dialog Box (p. 2484).

#### 36.6.9.1. Transform Surface Dialog Box

The Transform Surface dialog box allows you to create a new data surface by rotating and/or translating an existing surface, and/or by specifying a constant normal distance from it. See Transforming Surfaces (p. 1599) for details about the items below.
Controls

Rotate
contains the transformation parameters for rotation.

About
defines the origin about which the surface is rotated. You will specify a point, and the origin of the coordinate system for the rotation will be set to the specified point. For example, if you specified the point \((1,0)\) in 2D, rotation would be about the \(z\) axis anchored at \((1,0)\). You can either enter the point's coordinates in the \(x,y,z\) fields or click the Mouse Select button and select a point in the graphics window using the mouse.

Angles
define the angles about the \(x\), \(y\), and \(z\) axes (that is, the axes of the coordinate system with the origin defined under About) by which the surface is rotated. For 2D problems, you can specify rotation about the \(z\) axis only.

Translate
contains the transformation parameters for translation.

\(x,y,z\)
define the distance by which the surface is translated in each direction.

Iso-Distance
contains the transformation parameters for “isodistancing.”

d sets the normal distance between the original surface and the transformed surface.
**Transform Surface**
contains a list of existing surfaces from which you can select the surface to be transformed. The selected surface will remain unchanged; the transformation will create a new surface.

**New Surface Name**
designates the name of the new surface. The default is the concatenation of the transformation type (that is, iso-distance, rotate, or translate) and an integer which is the new surface ID.

**Create**
creates the surface.

**Manage...**
opens the Surfaces Dialog Box (p. 2248) in which you can rename and delete surfaces and determine their sizes.

### 36.6.10. Surface/Manage...

The Surface/Manage... menu item opens the Surfaces Dialog Box (p. 2248).

### 36.7. Display Menu

For additional information, see the following sections:
- 36.7.1. Display/Mesh...
- 36.7.2. Display/Graphics and Animations...
- 36.7.3. Display/Plots...
- 36.7.4. Display/Residuals...
- 36.7.5. Display/Options...
- 36.7.6. Display/Scene...
- 36.7.7. Display/Views...
- 36.7.8. Display/Lights...

- 36.7.17. Display/Mouse Buttons...

#### 36.7.1. Display/Mesh...

The Display/Mesh... menu item opens the Mesh Display Dialog Box (p. 1891).

#### 36.7.2. Display/Graphics and Animations...

The Display/Graphics and Animations... menu item opens the Graphics and Animations Task Page (p. 2280).

#### 36.7.3. Display/Plots...

The Display/Plots... menu item opens the Plots Task Page (p. 2333).
36.7.4. Display/Residuals...

The Display/Residuals... menu item opens the Residual Monitors Dialog Box (p. 2223).

36.7.5. Display/Options...

The Display/Options... menu item opens the Display Options Dialog Box (p. 2314).

36.7.6. Display/Scene...

The Display/Scene... menu item opens the Scene Description Dialog Box (p. 2317). This menu item becomes available when you display meshes, surfaces, contours, vectors, or pathlines in the graphics window.

36.7.7. Display/Views...

The Display/Views... menu item opens the Views Dialog Box (p. 2323).

36.7.8. Display/Lights...

The Display/Lights... menu item opens the Lights Dialog Box (p. 2328).

36.7.9. Display/Colormap...

The Display/Colormap... menu item opens the Colormap Dialog Box (p. 2329).

36.7.10. Display/Annotate...

The Display/Annotate... menu item opens the Annotate Dialog Box (p. 2332).

36.7.11. Display/Zone Motion...

The Display/Zone Motion... menu item opens the Zone Motion Dialog Box (p. 2199). This option is available for all dynamic mesh models.

36.7.12. Display/DTRM Graphics...

The Display/DTRM Graphics... menu item opens the DTRM Graphics Dialog Box (p. 2487).

36.7.12.1. DTRM Graphics Dialog Box

The DTRM Graphics dialog box allows you to display rays and clusters used by the DTRM. See Displaying Rays and Clusters for the DTRM (p. 813) for details.
Controls

Display Type contains options for the different items you can display.

Cluster specifies the display of clusters.

Ray specifies the display of rays.

Options contains check buttons that control display options.

Draw Mesh toggles between displaying and not displaying the mesh. The Mesh Display Dialog Box (p. 1891) is opened when Draw Mesh is selected.

Cluster Type specifies whether Surface clusters or Volume clusters are to be displayed. This section of the dialog box appears when Cluster is selected as the Display Type.

Cluster Selection contains options for cluster displays. This section of the dialog box appears when Cluster is selected as the Display Type.

Display All Clusters enables the display of all surface or volume clusters in the domain.

Ray Parameters contains controls for displaying rays. This section of the dialog box appears when Ray is selected as the Display Type.
**Theta Divisions, Phi Divisions**
control the number of rays being traced. (See Controlling the Rays (p. 781).)

**Nearest Point**
specifies a point \((X,Y,Z)\) near the cluster to be displayed (or the cluster from which the rays should start).

The **Nearest Point** controls are not available when **Display All Clusters** is selected under **Cluster Selection**.

**Select Point With Mouse**
is an alternative method for specifying the **Nearest Point** using your mouse, by clicking the button.

**Display**
displays the specified cluster(s) or rays.

### 36.7.13. Display/Import Particle Data...

The **Display/Import Particle Data...** menu item opens the **Import Particle Data Dialog Box (p. 2489)**.

#### 36.7.13.1. Import Particle Data Dialog Box

The **Import Particle Data** dialog box allows you to import particle history data for display purposes. See Importing Particle Data (p. 1218) for details.

![Import Particle Data Dialog Box](image)

**Controls**

**Options**
contains the check buttons that set various import particle data options.

**Auto Range**
toggles between automatic and manual setting of the particle data range.

**Draw Mesh**
toggles between displaying and not displaying the mesh. The **Mesh Display Dialog Box (p. 1891)** is opened when **Draw Mesh** is selected.
**Style**
allows you to select pathline style.

**Attributes...**
opens the Path Style Attributes Dialog Box (p. 2296). This allows you to modify the line width, cylinder radius or marker size.

**Color by**
contains a list from which you can select the scalar field to be used to color the particle data.

**Min,Max**
allows you to set the range when Auto Range is disabled.

**Steps**
sets the maximum number of steps a particle can advance.

**Skip**
allows you to “thin out” the pathlines.

**Display**
displays pathlines.

**Pulse**
animates the particle positions. The Pulse button will become the Stop! button during the animation, and you must click Stop! to stop the pulsing.

**Read...**
opens a file selection dialog box where you can enter a file name and a directory for the imported data.

### 36.7.14. Display/PDF Tables/Curves...

The Display/PDF Tables/Curves... menu item opens the PDF Table Dialog Box (p. 2490).

#### 36.7.14.1. PDF Table Dialog Box

You can display 2D plots and 3D surfaces showing the variation of species mole fraction, density, or temperature with the mean mixture fraction, mixture fraction variance, or enthalpy. See Postprocessing the Look-Up Table Data (p. 984) for details about the items below.
### Controls

**PDF Data Type**  
describes the system that you are displaying.

**Plot Variable**  
contains a drop-down list from which you can select temperature, density, or species fraction as the variable to be plotted.

**Scalar Dissipation**  
specifies the value of the **Scalar Dissipation** which is available for multiple flamelets only.

**Plot Type**  
gives you the choice of plotting a 3D surface or a slice of a 3D surface.

- **3D Surface**  
displays a 3D plot of the variation of species mole fraction, density, or temperature with the mean mixture fraction, mixture fraction variance, or enthalpy.

- **2D Curve on 3D Surface**  
consists of a 2D curve that is a slice of a 3D surface.

**Options**  
contains options specific to the display of 3D surfaces or 2D curves on 3D surfaces.
Draw Numbers Box
enabling this option displays a wireframe box with the numerical limits in each coordinate direction. This option is available only when 3D Surface is selected.

Write To File
specifies whether you want to write the plot data to a file. This option is available only when 2D Curve on 3D Surface is selected. The Plot button changes to a Write button when this option is enabled.

Surface Parameters
contains settings where discrete independent variables are held constant and where curve parameters are defined.

Constant Value of
specifies the discrete independent variable to be held constant in the lookup table. The choices are Scaled Heat Loss/Gain, MeanMixtureFraction, or Scaled Variance. For a two-mixture-fraction case, the Scaled Heat Loss/Gain is the only available option.

Slice by
allows you to select whether the 3D array of data points available in the look-up table will be sliced by Index or Value.

Index/Value
contains index/values and their ranges.

Index/Value
allows you to specify the discretization index or numerical value of the variable that is being held constant.

Min/Max
are the range of integer values that you are allowed to choose from or display.

Adiabatic
is the enthalpy slice index corresponding to the adiabatic case for which the enthalpy (Scaled Heat Loss/Gain) is held constant.

Curve Parameters
allows you to specify the X-Axis Function against which the plot variable will be displayed when 2D Curve on 3D Surface is selected.

X-Axis Function
allows you to select Mean Mixture Fraction or Scaled Variance against which the plot variable will be displayed.

Constant Value of Scaled Variance/Mean Mixture Fraction
allows you to specify the type of discretization for the variable that is being held constant.

Slice by
allows you to select whether the 3D array of data points available in the look-up table will be sliced by Index or Value.

Index/Value
contains index/values and their ranges.
**Index#/Value**
allows you to specify the discretization index or numerical value of the variable that is being held constant for the curve parameters.

**Min/Max**
are the range of integer values that you are allowed to choose from or display.

**Display**
displays the plot variable of the 3D surface.

**Plot**
plots the plot variable for the 2D curve on 3D surface.

**Write**
opens the The Select File Dialog Box (p. 15) where you will specify a name for the file containing plot data. This button appears when Write To File is enabled for the 2D Curve on 3D Surface plot type.

### 36.7.15. Display/Reacting Channel/Curves...

The Display/Reacting Channel/Curves... menu item opens the Reacting Channel 2D Curves Dialog Box (p. 1996) for postprocessing reacting channel variables.

### 36.7.16. Display/Video Control...

The Display/Video Control... menu item opens the Video Control Dialog Box (p. 2493) (Linux only).

### 36.7.16.1. Video Control Dialog Box

The Video Control dialog box is used to record animations or live action to video. When recording animations to video, you must first create your animation (see Creating an Animation (p. 1683)). The Video Control dialog box will play your animation and control a videotape recorder (VTR) to record it to video. See Creating Videos (p. 1686) for details about using the video tools.
Controls

**Video Device**
sets up the connection to the VTR control hardware.

**Protocol**
specifies the command protocol that identifies your VTR controller. ANSYS Fluent currently supports the following VTR controllers:

**V-LAN**
Machine Control Network is a command protocol developed by Videomedia, Inc. and supported by several videotape editing systems.

**MiniVAS**
is the command protocol for the MiniVAS and MiniVAS-2 VTR controllers developed by the V.A.S. Group.

To be able to control the video recording from ANSYS Fluent, your VTR controller must use one of these protocols.

**Serial Port**
identifies the name of the serial port to which your VTR controller is connected.

**Port #**
is a convenient way of changing the port number associated with the serial port.
Settings...

displays a dialog box that provides options specific to your VTR controller. If your VTR controller protocol is V-LAN, the V-LAN Settings Dialog Box (p. 2496) is displayed; if the protocol is MiniVAS, the MiniVAS Settings Dialog Box (p. 2498) is displayed.

Open

will open a connection to your VTR controller. Once the connection is open, the name of this push button will be changed to Close so that you can close the connection again.

Record Session

specifies the type of recording you want to perform.

Preblack

is the process of formatting a tape by laying down a time code onto the tape. A tape must be formatted before any frame accurate editing, including frame-by-frame animation, can be performed. During this process, one usually records a black video signal onto the tape as well, thus the name “preblack”. When you select this option the current graphics window will be cleared to black. You can use the window to send your black video signal to the VTR. Remember, when you preblack a previously formatted tape, a new time code will be written and any previously recorded video will be destroyed.

Live Action

allows you to record a live ANSYS Fluent session that can be used for demonstration. This option requires your computer’s video hardware to have a scan converter that will send the computer display image to your VTR system.

Animation

will play an animation that you have created, and record it onto your VTR system.

Options...

displays the Animation Recording Options Dialog Box (p. 2499), which provides options for recording your animation.

VTR Controls

function like the controls on your VTR’s front dialog box.

Time

is a counter that provides input/output of the current tape position. It will update automatically when the tape is repositioned. If you type a new time in this field and press Enter, the VTR will go to that position on the tape. For time code, the format is Hrs:Min:Sec:Frames, where the number of frames can range between 0 and 29. For example, a time code of 00:02:36:07 is 2 minutes, 36 seconds, and 7 frames. In order to go to this position on the tape, you can enter the time code as 2:36:07, leaving out the leading zeros, or you can simply enter 23607, leaving out the leading zeros and colons. If you select the Frame Code radio button, the tape position will be displayed in frames instead of time.

Record

will begin a recording session starting at the current position on the tape. If Preblack has been selected as the recording session, the label of this push button will be changed to Preblack.

Push Button Controls

enable you to operate the VTR’s tape transport.

<< rewinds the tape.
< | reverses the tape by one frame.
[ ] places the tape in stop mode.
| | places the tape in pause mode.
| > advances the tape by one frame.
> plays the tape at normal speed.
>> advances the tape in fast-forward mode.

**Shuttle**
allows you to advance (or reverse) the tape at varying speeds. When you move the shuttle to the right, the tape will be advanced; when you move it to the left, the tape will be reversed. The shuttle speed index ranges from -9 to 9. A speed index of 5 is equivalent to playing the tape at normal speed. A speed index of 0 is equivalent placing the tape in pause mode.

**Counter Format**
allows you to change the counter units displayed in the **Time/Frame** counter.

**Time Code**
when selected, displays the tape position as time code.

**Frame Code**
when selected, displays the tape position as frame code.

This format is for display/user-input purposes only and does not change the actual tape counter format.

**Picture...**
displays the **Picture Options Dialog Box** (p. 2502), which provides options for setting the picture size and color levels in the graphics window.

### 36.7.16.2. V-LAN Settings Dialog Box

The **V-LAN Settings** dialog box allows you to set specific V-LAN options. This dialog box is displayed by clicking on the **Settings...** push button in the **Video Control Dialog Box** (p. 2493), after you have selected V-LAN as your video device protocol.
Controls

V-LAN Node
identifies the node number of the VTR. This is always 1, unless you have several video devices connected to a V-LAN network, in which case, the VTR you want to use may be identified by another node number.

VTR Video Format
identifies the video format standard to which your VTR conforms. This setting is used to determine the video frame rate (frames/sec).

NTSC
(National Television Standards Committee) is the main video standard used in North America and Japan. The video frame rate is 30 frames/sec.

PAL
(Phase Alternate Line) is the video standard used by some countries in Western Europe, Asia, and Australia. The video frame rate is 25 frames/sec.

Preroll/Postroll
specifies the preroll and postroll times in seconds. These are used when performing Edit records, including frame-by-frame animation recording, to make sure the tape is moving at the proper speed through the recorded segment.

Preroll
is the number of seconds the tape will play up to the record in point.

Postroll
is the number of seconds the tape will play past the record out point.

The default settings should be sufficient for most VTR devices.
**Live/Real-Time Recording**

specifies the type of recording that will be performed during a live action or real-time animation recording session.

**Quick Record**

can be performed on a tape that has not been formatted or “preblacked”. This is also known as “full record”. Remember that this option will destroy any pre-existing time code on the tape.

**Edit (Preblacked Tape Required)**

is used for more precise recording. This mode allows you to record several back-to-back recordings with clean transitions between them.

For frame-by-frame animation recording, the record mode used is **Edit** regardless of this setting.

**Verbose Mode**

enables the echoing of each V-LAN command as it is sent to the V-LAN controller.

### 36.7.16.3. MiniVAS Settings Dialog Box

The *MiniVAS Settings* dialog box allows you to set specific MiniVAS options. This dialog box is displayed by clicking on the **Settings...** push button in the *Video Control Dialog Box* (p. 2493), after you have selected MiniVAS as your video device protocol.

**Controls**

**VTR Identification**

identifies the type of VTR the MiniVAS is connected to. The identification is a two-character code reserved for your VTR model (see your MiniVAS documentation for details). If left blank, this field is ignored and the MiniVAS will use the code that has been permanently stored in its ROM. It is recommended that you leave this field blank unless you know that a code change is required. If you open this dialog box after opening a connection to the MiniVAS, this field will contain the code that is stored in the MiniVAS.
VTR Video Format
identifies the video format standard to which your VTR conforms. This setting is used to determine the
video frame rate (frames/sec).

NTSC
(National Television Standards Committee) is the main video format used in North America and Japan.
The video frame rate is 30 frames/sec.

PAL
(Phase Alternate Line) is the video format used by some countries in Western Europe, Asia, and
Australia. The video frame rate is 25 frames/sec.

VTR Tape Format
specifies which counter format to use for editing. MiniVAS provides commands based on both time code
and frame code.

Time Code
instructs MiniVAS to control the VTR using time code.

Frame Code
instructs MiniVAS to control the VTR using frame code.

Preroll
specifies the preroll time in seconds. This is used when performing Edit records, including frame-by-frame animation recording, to make sure the tape is moving at the proper speed through the recorded segment. The value given is the number of seconds the tape will play up to the record in point. The default setting should be sufficient for most VTR devices.

Preblack Mode
specifies the mode used when you perform a preblack recording session.

Preblack
instructs the MiniVAS to perform a “hard” record on a previously unformatted tape. During this op-
eration, the MiniVAS will command the VTR to write both a time code and a VIFC frame code to the
tape.

Prestripe
instructs the MiniVAS to perform an “edit” record on a previously formatted tape that already has a
time code. During this operation, the MiniVAS will command the VTR to write a VIFC frame code to the
tape.

In either case, any previously recorded video will be destroyed.

Verbose Mode
enables the echoing of each MiniVAS command as it is sent to the MiniVAS controller.

36.7.16.4. Animation Recording Options Dialog Box

The Animation Recording Options dialog box allows you to set specific options for recording animations
to video. An animation is created using the Animate Dialog Box (p. 2308).
**Controls**

**Record Source**
identifies the video source used during a recording session.

**Screen**
inform ANSYS Fluent that the computer's video hardware will send all or a portion of the computer screen as a video signal to the VTR. This option assumes your computer's video system includes a scan converter and associated software that converts the computer RGB signal to a video signal. You are responsible for setting up the scan converter and sending the video signal to the VTR.

**Picture**
instructs ANSYS Fluent to create a picture of each frame of animation and send the picture file to the computer's video hardware using a system command. This option assumes that your computer's video system includes a frame buffer that can store an image and send it as a video signal to the video recording system.

**Picture Settings**
is used in conjunction with the **Picture** record source option.

**Video Command**
identifies the shell script command file used to send a picture file to the video frame buffer. The default setting is `videocmd`, which is a shell script that is included in your ANSYS Fluent distribution. It is located in `path/ansys_inc/v150/fluent/bin`, where `path` is the directory in which you have placed the release directory. This shell script will execute your system's command to send an image file to the video frame buffer. The script `videocmd` is set up to call the SGI system command `memtovid`. If you have a different system, you must copy the shell script `videocmd` to a new file and modify it to perform the proper task on your system (see the comments in `videocmd` for details).

**Picture Options...**
displays the Save Picture Dialog Box (p. 2309), which allows you to set up the picture format supported by your video frame buffer. If you choose to perform a window dump to create the picture file, the
The default window dump command used will also be `videocmd`. You can change this setting to use your own command. After setting the picture options, click **Apply** instead of **Save...** in the Save Picture Dialog Box (p. 2309) to effect the change.

**Preview**
will send a test picture of the current graphics picture to the video frame buffer. This can be used to check the image on your video recording system's monitor to see if the image size and color levels are acceptable.

**Record Mode**
specifies the method used to record the animation.

**Real-Time**
can be used if the animation playback speed is fast enough to provide a reasonably smooth animation in real-time. This is only available if the selected record source is **Screen**. In this mode, ANSYS Fluent will simply turn VTR recording on, play the animation, then stop the recording.

**Frame-By-Frame**
is used to produce a higher-quality video animation by recording one frame at a time. For each animation frame, this method will 1) play the frame on the screen (and generate the picture file, if needed), 2) preroll the VTR, and 3) record the frame. If the animation has 50 frames, this procedure is repeated 50 times, that is, 50 record passes are made. This is the recommended method, because the real-time playback of the animation will usually be too slow and choppy.

**Frames/Pass**
is used in conjunction with **Frame-By-Frame** recording to try and speed up this process, if possible. It specifies the number of animation frames recorded to tape per record pass. If the animation is long enough (200 frames or more), you can try setting this value to 2 or higher. For example, if you set this value to 2 for a 202-frame animation, it will record animation frame 1 during the first pass, frames 2 and 102 during the second pass, frames 3 and 103 during the third pass, and so on. This is possible only if the animation frames can be rendered in time to be inserted onto the tape during a record pass, so use this setting with caution.

**Frame Hold Counts**
specifies the number of video frames to hold an animation frame during recording. The video standard NTSC has a frame rate of 30 frames/sec. At that rate, a 150-frame animation will take only 5 seconds to play. To stretch out the animation, you can record the same animation frame over 2 or more video frames.

**Begin Hold**
specifies the number of video frames to hold the first animation frame. It helps to hold the first frame for about 5 seconds (150 video frames) so that the viewer can get accustomed to the picture before the animation begins.

**Frame Hold**
specifies the number of video frames to hold each animation frame, other than the first and last. To slow down your recorded animation, try setting this value to 2 or 3.

**End Hold**
specifies the number of video frames to hold the last animation frame. You may want to hold the last animation frame for about 5 seconds to provide closure.
36.7.16.5. Picture Options Dialog Box

The Picture Options dialog box allows you to adjust the color levels and size of the picture in the graphics window. This dialog box has an Apply push button, so as you adjust levels, you can click Apply to see the effect on the picture in the current graphics window. Each option has a presetting, so you can click Apply immediately to see the effect of the presettings.

![Picture Options Dialog Box](image)

**Controls**

**Color**

contains options for adjusting the color levels of the picture.

**Color Space**

lets you choose a filter that will restrict all colors to within a particular color range by modifying individual color values, if needed.

- **Computer**
  
  when selected, effectively turns off color filtering.

- **NTSC Video**
  
  when selected, restricts colors to the NTSC color space. NTSC (National Television Standards Committee) is the main video format used in North America and Japan.

- **PAL Video**
  
  when selected, restricts colors to the PAL color space. PAL (Phase Alternate Line) is the video format used by some countries in Western Europe, Asia, and Australia.

**Saturation (%)**

controls the percentage of color saturation (or purity) of the colors in the picture. A saturation in the range of 0-20% produces grayed-out colors. A saturation in the range of 40-60% produces pastel colors. A saturation in the range of 80-100% produces vivid colors. For video, this value should be no more than 80%.
**Brightness (%)**
controls the color brightness of the picture. When lowering the saturation, it is often desirable to lower the brightness a little bit as well to avoid pastel colors.

**Window Size**
allows you to resize the graphics window so that you can match up the size to your VTR device.

**Set Size**
lets you decide whether or not you want the **Width**, **Height**, and **Margin** values to be used to resize the graphics window.

**Width**
specifies the width in pixels of the new window size.

**Height**
specifies the height in pixels of the new window size.

**Margin**
specifies a margin in pixels to create around the picture. This can help you produce a video image that does not include unwanted parts of the screen, such as the window border.

### 36.7.17. Display/Mouse Buttons...

The **Display/Mouse Buttons...** menu item opens the Mouse Buttons Dialog Box (p. 2503).

#### 36.7.17.1. Mouse Buttons Dialog Box

The **Mouse Buttons** dialog box is used to set the actions taken when one of the mouse buttons is clicked in a graphics window. See Controlling the Mouse Button Functions (p. 1654) for details.

**Controls**

**Left**
sets the function associated with the left button. In 2D the default setting is **mouse-dolly**, and in 3D it is **mouse-rotate**.

**Middle**
sets the function associated with the middle button. The default setting for both 2D and 3D is **mouse-zoom**.

Right
sets the function associated with the right button. This button is not used on a two button mouse. The default setting for both 2D and 3D is `mouse-probe`.

Probe
turns the probe function on and off.

Fluent Defaults
sets the left, middle, right, and probe buttons as described above.

Workbench Defaults
sets the mouse buttons as follows:

Left
In 2D and 3D the default setting is `mouse-dolly`.

Middle
In 2D the default setting is `mouse-probe` and in 3D it is `mouse-rotate`.

Right
In 2D and 3D the default setting is `mouse-zoom`.

Probe
turns the probe function on and off.

### 36.8. Report Menu

For additional information, see the following sections:

36.8.1. Report/Result Reports...
36.8.2. Report/Input Summary...
36.8.3. Report/S2S Information...
36.8.4. Report/Reference Values...

#### 36.8.1. Report/Result Reports...

The `Report/Result Reports...` menu item opens the `Reports Task Page` (p. 2350).

#### 36.8.2. Report/Input Summary...

The `Report/Input Summary...` menu item opens the `Input Summary Dialog Box` (p. 2504).

#### 36.8.2.1. Input Summary Dialog Box

The `Input Summary` dialog box allows you to report the current settings for physical models, boundary conditions, material properties, and solution parameters. See `Generating a Summary Report` (p. 1762) for details about the items below.
Controls

**Report Options**
contains a selectable list of the information that is available for the report.

**Print**
prints the selected information to the console.

**Save...**
opens the *Select File Dialog Box (p. 15)*, in which you can specify the filename under which to save the output of the summary report.

### 36.8.3. Report/S2S Information...

The *Report/S2S Information...* menu item opens the *S2S Information Dialog Box (p. 2505)*.

#### 36.8.3.1. S2S Information Dialog Box

The *S2S Information* dialog box allows you to report values of the view factor and radiation emitted from one zone to any other zone. See *Reporting Radiation in the S2S Model (p. 814)* for details about the items below.
Controls

Report Options
contains items for which information is available for reporting.

View Factors
turns on the computation of view factors from one zone to the other.

Incident Radiation
turns on the computation of the incident radiation from one zone to the other.

Boundary Types
contains a selectable list of types of boundary zones. If you select (or deselect) an item in this list, all zones of that type will be selected (or deselected) automatically in the From and To lists.

From
contains a selectable list of boundary zones for which you would like data reported from the selected zone.

To
contains a selectable list of boundary zones for which you would like data reported to the selected zone.

Compute
computes the view factors and/or incident radiation on the selected zones.

Write...
opens the Select File Dialog Box (p. 15), which you can use to save the data as an S2S Info File (.sif format).

36.8.4. Report/Reference Values...
The Report/Reference Values... menu item opens the Reference Values Task Page (p. 2202).

36.9. Parallel Menu

For additional information, see the following sections:
36.9.1. Parallel/Auto Partition...
36.9.2. Parallel/Partitioning and Load Balancing...
36.9.3. Parallel/Thread Control...
36.9.4. Parallel/Network/Database...
36.9.5. Parallel/Network/Configure...
36.9.6. Parallel/Network/Show Connectivity...
36.9.7. Parallel/Network/Show Latency
36.9.8. Parallel/Network/Show Bandwidth
36.9.9. Parallel/Timer/Usage
36.9.10. Parallel/Timer/Reset

36.9.1. Parallel/Auto Partition...
The Parallel/Auto Partition... menu item opens the Auto Partition Mesh Dialog Box (p. 2507).
36.9.1.1. Auto Partition Mesh Dialog Box

The Auto Partition Mesh dialog box allows you to set the parameters for automatic partitioning when reading an unpartitioned mesh into the parallel solver. See Partitioning the Mesh Automatically (p. 1854) for details.

Controls

Method
contains a drop-down list of the recursive partition methods that can be used to create the mesh partitions. The choices include the Cartesian Axes, Cartesian Strip, Cartesian X-Coordinate, Cartesian Y-Coordinate, Cartesian Z-Coordinate, Cartesian R Axes, Cartesian RX-Coordinate, Cartesian RY-Coordinate, Cartesian RZ-Coordinate, Cylindrical Axes, Cylindrical R-Coordinate, Cylindrical Theta-Coordinate, Cylindrical Z-Coordinate, Metis, Polar Axes, Polar R-Coordinate, Polar R-Coordinate, Polar Theta-Coordinate, Principal Axes, Principal Strip, Principal X-Coordinate, Principal Y-Coordinate, Principal Z-Coordinate, Spherical Axes, Spherical Rho-Coordinate, Spherical Theta-Coordinate, and Spherical Phi-Coordinate techniques, which are described in Mesh Partitioning Methods (p. 1868).

Case File
allows you to use a valid existing partition section in a case file (that is, one where the number of partitions in the case file divides evenly into the number of compute nodes). You need to turn off the Case File option only if you want to change other parameters in the Auto Partition Mesh dialog box.

Across Zones
allows partitions to cross zone boundaries (the default). If turned off, it will restrict partitioning to within each cell zone. This is recommended only when cells in different zones require significantly different amounts of computation during the solution phase, for example if the domain contains both solid and fluid zones.

Optimizations
contains a toggle button to activate pre-testing.

Pre-Test
instructs Fluent to test all coordinate directions and choose the one which yields the fewest partition interfaces for the final bisection. Note that this option is available only when you choose Principal Axes or Cartesian Axes as the partitioning method.

36.9.2. Parallel/Partitioning and Load Balancing...

The Parallel/Partitioning and Load Balancing... menu item opens the Partitioning and Load Balancing Dialog Box (p. 2508).
### 36.9.2.1. Partitioning and Load Balancing Dialog Box

The **Partitioning and Load Balancing** dialog box allows you to partition the mesh into separate clusters of cells for separate processors on a parallel computer. Note that the **Partitioning and Load Balancing** dialog box is slightly different in the serial and parallel solvers. See *Partitioning the Mesh Manually and Balancing the Load* (p. 1856) for details.

The **Partitioning and Load Balancing** dialog box also allows you to enable and control ANSYS Fluent’s load balancing feature. Load balancing will automatically detect and analyze parallel performance, and redistribute cells between the existing compute nodes to optimize it. See *Load Balancing* (p. 1866) for more information about load balancing.

#### Controls

**Method** contains a drop-down list of the recursive partition methods that can be used to create the mesh partitions. The choices include the **Cartesian Axes**, **Cartesian Strip**, **Cartesian X-Coordinate**, **Cartesian Y-Coordinate**, **Cartesian Z-Coordinate**, **Cartesian R Axes**, **Cartesian RX-Coordinate**, **Cartesian RY-Coordinate**, **Cartesian RZ-Coordinate**, **Cylindrical Axes**, **Cylindrical R-Coordinate**, **Cylindrical Theta-Coordinate**, **Cylindrical Z-Coordinate**, **Metis**, **Polar Axes**, **Polar R-Coordinate**, **Polar Theta-Coordinate**, **Principal Axes**, **Principal Strip**, **Principal X-Coordinate**, **Principal Y-Coordinate**, **Principal Z-Coordinate**, **Spherical Axes**, **Spherical Rho-Coordinate**, **Spherical Theta-Coordinate**, and **Spherical Phi-Coordinate** techniques, which are described in *Mesh Partitioning Methods* (p. 1868).

**Options** tab
Number of Partitions
defines the desired number of mesh partitions. This usually matches the number of processors available for parallel computing.

Reporting Verbosity
specifies the amount of information to be reported in the text (console) window during the partitioning. With the default value of 1, Fluent will print the number of partitions created, the number of bisections performed, the time required for the partitioning, and the minimum and maximum cell, face, interface, and face-ratio variations. (See Interpreting Partition Statistics (p. 1875) for details.) If you increase the Reporting Verbosity to 2, the partition method used, the partition ID, number of cells, faces, and interfaces, and the ratio of interfaces to faces for each partition will also be printed in the console window. If you decrease the Reporting Verbosity to 0, only the number of partitions created and the time required for the partitioning will be reported.

Across Zones
allows partitions to cross zone boundaries (the default). If turned off, it will restrict partitioning to within each cell zone. This is recommended only when cells in different zones require significantly different amounts of computation during the solution phase, for example if the domain contains both solid and fluid zones.

Reordering Method
is used to optimize parallel performance

Architecture Aware
is the default option and it accounts for the system architecture and network topology in remapping the partitions to the processors.

Reverse Cuthill-McKee
minimizes the bandwidth of the compute-node connectivity matrix (the maximum distance between two connected processes) without incorporating the system architecture.

Optimization
tab contains toggle buttons for activating schemes to optimize the partitions created by the selected partition method. In addition, the optimization scheme will be applied until appropriate criteria are met, or the maximum number of iterations have been executed. If the Iterations counter is set to 0, the optimization scheme will be applied until completion, without limit on the maximum number of iterations.

Merge
attempts to decrease the number of interfaces by eliminating orphan cell clusters (an orphan cluster is a group of connected cells whose members each have at least one face coincident with an interface boundary).

Smooth
attempts to minimize the number of interfaces by sacrificing cells on the partition boundary to the neighboring partition to reduce the partition boundary surface area.

Pre-Test
instructs Fluent to test all coordinate directions and choose the one which yields the fewest partition interfaces for the final bisection. Note that this option is available only when you choose Principal Axes or Cartesian Axes as the partitioning method.

Weighting	tab allows you to set the appropriate weights, prior to partitioning the mesh.
Weight Types
allows you to turn on/off a specific weight. Weight types include: Faces per Cell (which is enabled by default, with additional weighting of 2), Solid Zones (available only if solid cell zones are defined); VOF (available only if the volume of fluid multiphase model is turned on); DPM (available only for discrete phase simulations with injections defined), where you can specify Hybrid Optimization; and ISAT.

User-Specified
allows you to use the default value (by not selecting the check box), or to specify a value yourself (by selecting the check box and entering a numerical value in the Value field).

Value
allows you to enter a user-specified numerical value that either defines the ratio used in the weighting, or (for the Faces per Cell weighting) is added to the calculated weight of each cell.

Dynamic Load Balancing
tab allows you to set load balancing thresholds and intervals.

Physical Models
allows you to set thresholds and intervals for the simulation's physical models.

Threshold
is a percentage and depending on the value, load balancing will occur if the load imbalance is greater than the value entered.

Interval
allows you to specify the desired interval for load balancing cycles, in terms of number of iterations. When a value of 0 is specified, ANSYS Fluent will internally determine the best value to use, initially using an interval of 25 iterations. You can override this behavior by specifying a non-zero value. ANSYS Fluent will then attempt to perform load balancing after every N iterations, where N is the specified Balance Interval.

Dynamic Mesh
allows you to set load balancing threshold and interval values for your dynamic mesh. This option is only available when the dynamic mesh model is enabled.

Auto
allows a percentage of interface faces and loads to be automatically traced.

Threshold
is a percentage and depending on the value, load balancing will occur if the load imbalance is greater than the value entered.

Interval
allows you to specify the desired interval for load balancing cycles, in terms of number of iterations. When a value of 0 is specified, ANSYS Fluent will internally determine the best value to use, initially using an interval of 25 iterations. You can override this behavior by specifying a non-zero value. ANSYS Fluent will then attempt to perform load balancing after every N iterations, where N is the specified Balance Interval.

Mesh Adaption
allows you to set threshold values for mesh adaption.
Threshold

is a percentage and depending on the value, load balancing will occur if the load imbalance is greater than the value entered.

Zones

contains a list of cell zones. Partitioning will be applied to cells in zones selected from this list.

Registers

contains a list of cell registers that have been created using the adaption tools. You can restrict partitioning to a group of cells by selecting a register containing the cells. See Partitioning Within Zones or Registers (p. 1865) for details.

Print Active Partitions

(parallel solver only) prints the partition ID, number of cells, faces, and interfaces, and the ratio of interfaces to faces for each active partition (see Checking the Partitions (p. 1875) for information about active partitions) in the console window. In addition, it prints the minimum and maximum cell, face, interface, and face-ratio variations.

Print Stored Partitions

(parallel solver only) prints the partition ID, number of cells, faces, and interfaces, and the ratio of interfaces to faces for each stored partition (see Checking the Partitions (p. 1875) for information about stored partitions) in the console window. In addition, it prints the minimum and maximum cell, face, interface, and face-ratio variations.

Print Partitions

(serial solver only) prints the partition ID, number of cells, faces, and interfaces, and the ratio of interfaces to faces for each stored partition in the console window. In addition, it prints the minimum and maximum cell, face, interface, and face-ratio variations.

Set Selected Zones and Registers to Partition ID

allows you to set a value that assigns selected Zones and/or Registers to a specific partition ID. A region or zone is marked before setting the marked cells to one of the partition IDs.

Use Stored Partitions

(parallel solver only) allows you to make the stored cell partitions the active cell partitions. The active cell partition is used for the current calculation, while the stored cell partition (the last partition performed) is used when you save a case file.

Partition

subdivides the mesh into the selected number of partitions using the prescribed method and optimization(s).

Default

sets all controls to their default values, as assigned by ANSYS Fluent. After execution, the Default button becomes the Reset button.

Reset

resets the fields to their most recently saved values (that is, the values before Default was selected). After execution, the Reset button becomes the Default button.

36.9.3. Parallel/Thread Control...

The Parallel/Thread Control... menu item opens the Thread Control Dialog Box (p. 2512).
36.9.3.1. Thread Control Dialog Box

The Thread Control dialog box allows you to control the maximum number of threads on each machine, as described in Controlling the Threads (p. 1879).

![Thread Control Dialog Box]

**Controls**

**Maximum Number of Spawned Threads**
contains a list of options for defining the maximum number of threads on each machine.

- **Number of Node Processes on Machine**
specifies that the maximum number of threads on each machine is equal to the number of ANSYS Fluent node processes on each machine.

- **Number of Cores on Machine**
specifies that the maximum number of threads on each machine is equal to the number of cores on the machine. ANSYS Fluent obtains the number of cores from the OS.

- **Fixed Number**
specifies that the maximum number of threads that can be spawned on each machine is equal to the number you provide in the number-entry box below Fixed Number.

36.9.4. Parallel/Network/Database...

The Parallel/Network/Database... menu item opens the Hosts Database Dialog Box (p. 2512).

**Important**

The ability to read a hosts file using the Hosts Database dialog box is only available when using the net option (for example, -mpi=net). While this feature is still available in ANSYS Fluent 6.3, its use is discouraged.

36.9.4.1. Hosts Database Dialog Box

When you are creating a parallel network of workstations, it is convenient to start with a list of machines that are part of your local network (a "hosts file"). You can load a file containing these names into the hosts database and then select the hosts that are available for creating a parallel configuration (or network) on a cluster of workstations.
The **Hosts Database** dialog box allows you to read a hosts file and copy selected entries to the list of available hosts in the **Network Configuration Dialog Box (p. 2514)**.

Parallel → Network → **Database...**

![Hosts Database Dialog Box]

### Controls

**Hosts**
- contains a selectable list of local host names. The default list consists of the hosts in your `fluent.hosts` or `.fluent.hosts` file, if you have one in your home directory. You can load other hosts files using the **Load** button.

- If the hosts file exists in your home directory, its contents are automatically added to the hosts database at startup. Otherwise, the hosts database will be empty until you read in a hosts file.

- Once the contents of the hosts file have been read, the host names will appear in the **Hosts** list. (ANSYS Fluent will automatically add the IP (Internet Protocol) address for each recognized machine. If a machine is not currently on the local network, it will be labeled **unknown**.)

**Copy**
- copies selected entries to the list of available hosts in the **Network Configuration Dialog Box (p. 2514)** on which you can spawn nodes.

**Load...**
- opens the **Select File** Dialog Box (p. 15), which allows you to read a hosts file containing a list of local host names.
36.9.5. Parallel/Network/Configure...

The Parallel/Network/Configure... menu item opens the Network Configuration Dialog Box (p. 2514).

**Important**

The ability to manually spawn additional compute nodes before reading the case file using the Network Configuration dialog box is only available when using the net option (for example, -mpi=net). While this feature is still available in ANSYS Fluent 6.3, its use is discouraged.

36.9.5.1. Network Configuration Dialog Box

Compute nodes are labeled sequentially starting at 0. In addition to the compute node processes, there is one host process. The host process is automatically started when ANSYS Fluent starts, and it is killed when ANSYS Fluent exits. It cannot be killed while running. Compute nodes, however, can be killed at any time, with the exception that compute node 0 can only be killed if it is the last remaining compute node process. The host process always spawns compute node 0. Compute node 0 spawns all other compute nodes.

If you want to spawn compute nodes on several different machines, or if you want to make any changes to the current network configuration (for example, if you accidentally spawned too many compute nodes on the host machine when you started Fluent), the Network Configuration Dialog Box (p. 2514) allows you to control the configuration of your parallel network.

Parallel → Network → Configure...

---

**Available Hosts**

@testlnx1 [10.1.1.151]  
@testlnx2 [10.1.1.153]  
@testlnx3 [10.1.1.155]  
@testlnx4 [10.1.1.156]  

**Spawned Compute Nodes**

Windows-32 smfpc sm0  
Windows-32 smfpc sm1  
Windows-32 smfpc sm2

**Controls**

- Add
- Delete
- Save...
- Spawn
- Kill
- Close
- Help
Available Hosts
contains a selectable list of hosts available for creating a parallel machine. If the hosts file `fluent.hosts` exists in your home directory, its contents are automatically added to the Available Hosts list at startup. Hosts can be added to the list either by specifying a hostname and optional username in the Host Entry box, or by copying selected hosts from the Hosts Database Dialog Box (p. 2512).

Spawned Compute Nodes
contains the list of all compute node processes that form the parallel machine. Each entry lists the operating system, hostname, username, and compute node ID, in that order. Compute nodes can be added to this list by selecting hosts from the Available Hosts list.

Host Entry
is used to manually add and delete hosts from the Available Hosts list.

Hostname
is the internet name of a remote machine.

Username
is your login name on the machine specified in the Hostname field. If all your accounts have the same login name, you do not need to specify a username.

Spawn Count
defines the number of compute node processes to spawn on each selected host in the Available Hosts list.

Database...
opens the Hosts Database Dialog Box (p. 2512).

Connectivity
displays the network connectivity of all compute nodes selected in the Spawned Compute Nodes list. If no compute nodes are selected, the Parallel Connectivity Dialog Box (p. 2517) is opened.

Add
adds a workstation from the Host Entry box to the Available Hosts list.

To add a host to the Available Hosts list manually, you can enter the internet name of the remote machine in the Hostname field under Host Entry, enter your login name on that machine in the Username field (unless your accounts all have the same login name, in which case you need not specify a username), and then click the Add button. The specified host will be added to the Available Hosts list.

Delete
removes the host specified in the Host Entry box or selected in the Available Hosts list from the Available Hosts list.

To delete a host from the Available Hosts list in the Network Configuration Dialog Box (p. 2514), select the host and click the Delete button. The host name will be removed from the Available Hosts list (but the Hosts Database Dialog Box (p. 2512) will not be affected).

Save...
opens The Select File Dialog Box (p. 15), which allows you to write a hosts file for future use that contains all entries in the Available Hosts list. In a future session, you can load the contents of this file into the Hosts Database Dialog Box (p. 2512) and then copy the hosts over to the Network Configuration Dialog Box (p. 2514) in order to reproduce the current Available Hosts list.
Spawn
creates compute node processes on all hosts selected in the Available Hosts list.

Kill
kills the compute node processes selected in the Spawned Compute Nodes list.

**Important**
Remember that compute node 0 can only be killed if it is the last remaining compute node process.

The basic steps for spawning compute nodes are as follows:

1. Choose the host machine(s) on which to spawn compute nodes in the Available Hosts list. If the desired machine is not listed, you can use the Host Entry fields to manually add a host, or you can copy the desired host from the host database.

2. Set the number of compute node processes to spawn on each selected host machine in the Spawn Count field.

3. Click the Spawn button and the new node(s) will be spawned and added to the Spawned Compute Nodes list.

**Common Problems Encountered During Node Spawning**
The spawning process will try to establish a connection with a new compute node, but if after 50 seconds it receives no response from the new compute node, it will assume the spawn was unsuccessful. The spawn will be unsuccessful, for example, if the remote machine is unable to find the ANSYS Fluent executable. To manually test if the spawning machine can start a new compute node, you can type

```
rsh [-l username] hostname fluent -t0 -v
```

from a shell prompt on the spawning machine. hostname should be replaced with the internet name of the machine on which you want to spawn a compute node, and username should be replaced with your login name on the remote machine specified by hostname.

**Important**
If all your accounts have the same login name, you do not need to specify a username. (The square brackets around -l username indicate that it is not always required; if you do enter a login name, do not include the square brackets.) Note that on some systems, the remote shell command is remsh instead of rsh.

The spawn test could fail for several reasons:

**Login incorrect.**
The machine spawning a new compute node must be able to rsh to the machine where the new process will reside, or the spawn will fail. There are several ways to enable this capability. Consult your systems administrator for assistance.

**fluent: Command not found.**
The rsh to the remote machine succeeded, but the path to the ANSYS Fluent shell script could not be found on that machine. If you are using csh, then the path to the ANSYS Fluent shell script should be
added to the path variable in your .cshrc file. If that also fails, you can use the parallel/network/path text command to set the path to the path/ansys_inc/v150/fluent installation directory directly before spawning the compute node.

```
parallel → network → path
```

### 36.9.6. Parallel/Network/Show Connectivity...

The Parallel/Network/Show Connectivity... menu item opens the Parallel Connectivity Dialog Box (p. 2517).

#### 36.9.6.1. Parallel Connectivity Dialog Box

The Parallel Connectivity dialog box prints the connectivity of the selected compute node. See Checking Network Connectivity (p. 1880) for details.

![Parallel Connectivity Dialog Box](image)

**Controls**

**Compute Node**

indicates the compute node ID for which connectivity information is desired.

**Print**

prints information (in the console window) about the network connectivity for the selected compute node.

### 36.9.7. Parallel/Network/Show Latency

The Parallel/Network/Show Latency menu item prints information to the console about the communication speed for each node, as well as minimum and maximum latency between two nodes. See Checking Latency and Bandwidth (p. 1884) for details.

### 36.9.8. Parallel/Network/Show Bandwidth

The Parallel/Network/Show Bandwidth menu item prints information to the console about the amount of data communicated within one second between two nodes, as well as minimum and maximum bandwidth between two nodes. See Checking Latency and Bandwidth (p. 1884) for details.

### 36.9.9. Parallel/Timer/Usage

The Parallel/Timer/Usage menu item prints performance statistics in the console.

### 36.9.10. Parallel/Timer/Reset

The Parallel/Timer/Reset menu item clears the performance meter.
36.10. View Menu

For additional information, see the following sections:

36.10.1. View/Toolbars
36.10.2. View/Navigation Pane
36.10.3. View/Task Page
36.10.4. View/Graphics Window
36.10.5. View/Embed Graphics Window
36.10.6. View/Show All
36.10.7. View/Show Only Console
36.10.8. View/Graphics Window Layout
36.10.9. View/Save Layout

36.10.1. View/Toolbars

The View/Toolbars menu item allows you to toggle the visibility of the toolbars in the application window.

36.10.2. View/Navigation Pane

The View/Navigation Pane menu item allows you to toggle the visibility of the navigation pane in the application window.

36.10.3. View/Task Page

The View/Task Page menu item allows you to toggle the visibility of the task pages in the application window.

36.10.4. View/Graphics Window

The View/Graphics Window menu item allows you to toggle the visibility of the graphics window in the application window. This option is only visible when the graphics window is embedded in the application.

36.10.5. View/Embed Graphics Window

The View/Embed Graphics Window menu item allows you to toggle between attaching and detaching the graphics window within the application.

36.10.6. View/Show All

The View/Show All menu item allows you to display the toolbars, the navigation pane, the task pages, and the graphics window, if one or more of them is currently not visible.

36.10.7. View/Show Only Console

The View/Show Only Console menu item allows you to display only the console window in the application.
36.10.8. View/Graphics Window Layout

The **View/Graphics Window Layout** menu item displays several layout options for use with multiple graphics windows. This option is only visible when the graphics window is embedded in the application.

36.10.9. View/Save Layout

The **View/Save Layout** menu item is used to save the current arrangement of dialog boxes and graphics windows. The positions of these items on your screen will be written to a `.cxlayout` file in your home folder.

36.11. Turbo Menu

For additional information, see the following sections:
- 36.11.1. Turbo/Report...
- 36.11.2. Turbo/Averaged Contours...
- 36.11.3. Turbo/2D Contours...
- 36.11.4. Turbo/Averaged XY Plot...
- 36.11.5. Turbo/Options...

36.11.1. Turbo/Report...

The **Turbo/Report...** menu item opens the Turbo Report Dialog Box (p. 2519).

36.11.1.1. Turbo Report Dialog Box

The **Turbo Report** dialog box allows you to calculate turbomachinery-specific quantities and integrals. SeeGenerating Reports of Turbomachinery Data (p. 1717) for details.
**Controls**

**Inlet/Outlet Data**
contains quantities that can be calculated at inlets and outlets.

- **Averages** allows you to choose between **Mass-Weighted** and **Area-Weighted** averages for all applicable computed quantities. These quantities are calculated for the **Inlet** and **Outlet** topologies where applicable.

- **Turbo Topology** contains a list of defined topologies. Select from the list to display the values for the selected topology.

**Mass Flow**
is the mass flow rate through a surface as defined in **Equation 31.2 (p. 1718)**.

**Swirl Number**
is the swirl number as defined in **Equation 31.3 (p. 1718)**.
Average Total Pressure
is the area-averaged or mass-averaged total pressure as defined in Equation 31.4 (p. 1718) or Equation 31.5 (p. 1719).

Average Total Temperature
is the area-averaged or mass-averaged total temperature as defined in Equation 31.6 (p. 1719) or Equation 31.7 (p. 1719).

Average Radial Flow Angle
is the area-averaged or mass-averaged radial flow angle as defined in Equation 31.8 (p. 1720) or Equation 31.10 (p. 1720).

Average Theta Flow Angle
is the area-averaged or mass-averaged tangential flow angle as defined in Equation 31.9 (p. 1720) or Equation 31.11 (p. 1720).

Losses
contains the values of loss-related coefficients.

Engr. Passage Loss Coef
is the engineering loss coefficient as defined in Equation 31.12 (p. 1720).

Norm. Passage Loss Coef
is the normalized loss coefficient as defined in Equation 31.13 (p. 1721).

Forces
contains the axial force and the torque on the rotating parts.

Axial Force
is the axial force on the rotating parts as defined in Equation 31.14 (p. 1721).

Torque
is the torque on the rotating parts as defined in Equation 31.15 (p. 1721).

Efficiencies
contains the values of isentropic, polytropic and hydraulic efficiencies.

Isentropic
is the isentropic efficiency for a compressor or a turbine (motor) calculated in the presence of a compressible working fluid as defined in Equation 31.20 (p. 1723) or Equation 31.26 (p. 1725).

Polytropic
is the polytropic efficiency for a compressor or a turbine (motor) calculated in the presence of a compressible working fluid as defined in Equation 31.21 (p. 1723) or Equation 31.27 (p. 1725).

Hydraulic
is the hydraulic efficiency for a pump or a hydraulic turbine (motor) calculated in the presence of an incompressible working fluid as defined in Equation 31.16 (p. 1722) or Equation 31.22 (p. 1724).

Compute
starts the calculation of the quantities in all the fields in the Turbo Report dialog box. Note that this process may take some time for a large problem.

Write...
opens the Select File dialog box, which you can use to save the reported values to a file.
36.11.2. Turbo/Averaged Contours...

The Turbo/Averaged Contours... menu item opens the Turbo Averaged Contours Dialog Box (p. 2522).

36.11.2.1. Turbo Averaged Contours Dialog Box

The Turbo Averaged Contours dialog box allows you display turbomachinery-specific circumferentially averaged contours of variables projected on an \( r-z \) plane. See Displaying Turbomachinery Averaged Contours (p. 1725) for details.

Controls

**Turbo Topology**
- contains a list of defined topologies. Select from the list to display the values for the selected topology.

**Options**
- contains the check buttons that set various contour display options.
  - **Filled**
    - toggles between filled contours and line contours.
  - **Auto Range**
    - toggles between automatic and manual setting of the contour range. Any time you change the Contours of selection, Auto Range is reset to on.
  - **Clip to Range**
    - determines whether or not values outside the prescribed Min/Max range are contoured when using Filled contours. If selected, values outside the range will not be contoured. If not selected, values below the Min value will be colored with the lowest color on the color scale, and values above the Max value will be colored with the highest color on the color scale. See Specifying the Range of Magnitudes Displayed (p. 1616) for details.

**Levels**
- sets the number of contour levels that are displayed.

**Setup**
- indicates the ID number of the contour setup. For frequently used combinations of contour fields and options, you can store the information needed to generate the contour plot by specifying a Setup.
number and setting up the desired information in the dialog box. See Storing Contour Plot Settings (p. 1619) for details.

Contours of
contains a list from which you can select the scalar field to be contoured.

Min
shows the minimum value of the scalar field. If Auto Range is off, you can set the minimum by typing a new value.

Max
shows the maximum value of the scalar field. If Auto Range is off, you can set the maximum by typing a new value.

Domain Min
shows the global minimum value of the scalar field for the entire domain.

Domain Max
shows the global maximum value of the scalar field for the entire domain.

Display
draws the contours in the active graphics window.

Compute
calculates the scalar field and updates the Min and Max values (even when Auto Range is off).

36.11.3. Turbo/2D Contours...

The Turbo/2D Contours... menu item opens the Turbo 2D Contours Dialog Box (p. 2523).

36.11.3.1. Turbo 2D Contours Dialog Box

The Turbo 2D Contours dialog box allows you display turbomachinery-specific contours of variables on surfaces of constant pitchwise, spanwise, or meridional coordinates, projected onto a plane. See Displaying Turbomachinery 2D Contours (p. 1727) for details.
**Turbo Topology**

contains a list of defined topologies. Select from the list to display the values for the selected topology.

**Options**

contains the check buttons that set various contour display options.

- **Filled**
  
  toggles between filled contours and line contours.

- **Node Values**
  
  toggles between using scalar field values at nodes and at cell centers for computing the contours.

- **Global Range**
  
  toggles between basing the minimum and maximum values on the range of values on the selected surfaces (off), and basing them on the range of values in the entire domain (on, the default).

- **Auto Range**
  
  toggles between automatic and manual setting of the contour range. Any time you change the Contours of selection, **Auto Range** is reset to on.

- **Clip to Range**
  
  determines whether or not values outside the prescribed **Min***/ **Max* range are contoured when using **Filled** contours. If selected, values outside the range will not be contoured. If not selected, values below the **Min** value will be colored with the lowest color on the color scale, and values above the **Max** value will be colored with the highest color on the color scale. See **Specifying the Range of Magnitudes Displayed** (p. 1616) for details.

- **Levels**
  
  sets the number of contour levels that are displayed.

- **Setup**
  
  indicates the ID number of the contour setup. For frequently used combinations of contour fields and options, you can store the information needed to generate the contour plot by specifying a **Setup** number and setting up the desired information in the dialog box. See **Storing Contour Plot Settings** (p. 1619) for details.

- **Contours of**
  
  contains a list from which you can select the scalar field to be contoured.

- **Min**
  
  shows the minimum value of the scalar field. If **Auto Range** is off, you can set the minimum by typing a new value.

- **Max**
  
  shows the maximum value of the scalar field. If **Auto Range** is off, you can set the maximum by typing a new value.

- **Normalised Spanwise Coordinates (0 to 1)**
  
  allows you to specify the coordinate for the spanwise surface you want to create.

- **Display**
  
  draws the contours in the active graphics window.

- **Compute**
  
  calculates the scalar field and updates the **Min** and **Max** values (even when **Auto Range** is off).
36.11.4. Turbo/Averaged XY Plot...

The Turbo/Averaged XY Plot... menu item opens the Turbo Averaged XY Plot Dialog Box (p. 2525).

36.11.4.1. Turbo Averaged XY Plot Dialog Box

The Turbo Averaged XY Plot dialog box allows you to display data in an XY plot format as a function of either the meridional or the spanwise coordinate. See Generating Averaged XY Plots of Turbomachinery Solution Data (p. 1729) for details.

Controls

Y Axis Function
contains a list of solution variables that can be used for the y axis of the plot.

Min
shows the minimum value of the scalar field.

Max
shows the maximum value of the scalar field.

Turbo Topology
contains a list of defined topologies. Select from the list to display the values for the selected topology.

X Axis Function
allows you to select the coordinate to be used for the x axis of the plot. The choices are Hub to Casing Distance (spanwise coordinate), and Meridional Distance (meridional coordinate).

Fractional Distance
sets a fractional value (0 to 1) for either the spanwise Hub to Casing distance or the meridional Inlet to Outlet distance, depending on your selection for X Axis Function.

Write to File
activates the file-writing option. When this option is selected, the Plot push button will change to Write.... Clicking on the Write... button will open the The Select File Dialog Box (p. 15), in which you can specify a name and save a file containing the plot data. The format of this file is described in XY Plot File Format (p. 1707).
Plot
plots the specified surface and/or file data in the active graphics window using the current axis and curve attributes. If the Write to File option is turned on, this button becomes the Write... button.

Write...
opens the The Select File Dialog Box (p. 15), in which you can save the plot data to a file. This button replaces the Plot button when the Write to File option is turned on.

Compute
calculates the scalar field and updates the Min and Max values.

Axes...
opens the Axes Dialog Box (p. 2347), which allows you to customize the plot axes.

Curves...
opens the Curves Dialog Box (p. 2349), which allows you to customize the curves used in the XY plot.

36.11.5. Turbo/Options...
The Turbo/Options... menu item opens the Turbo Options Dialog Box (p. 2526).

36.11.5.1. Turbo Options Dialog Box
The Turbo Options dialog box allows you to globally set the turbomachinery topology for your model. See Globally Setting the Turbomachinery Topology (p. 1730) for details.

Controls

Current Topology
contains a list of predefined turbo topologies.

36.12. Help Menu
For additional information, see the following sections:
  36.12.1. Help/User’s Guide Contents...
  36.12.2. Help/PDF...
  36.12.3. Help/Context-Sensitive Help
  36.12.4. Help/Using Help...
  36.12.5. Help/Online Technical Resources...
  36.12.6. Help/License Usage
  36.12.7. Help/Version...

36.12.1. Help/User’s Guide Contents...
The Help/User’s Guide Contents... menu item opens the help viewer to the Table of Contents page of the User’s Guide. See Using the GUI Help System (p. 24) for details.
36.12.2. Help/PDF...

The Help/PDF... menu item displays a submenu that allows you access to the User's Guide and other manuals in printable format (PDF).

36.12.3. Help/Context-Sensitive Help

The Help/Context-Sensitive Help menu item allows you to get help for a specific topic represented by a pull-down menu item, a dialog box, or another part of the graphical user interface. When you select Context-Sensitive Help, the screen cursor will change to the shape of a question mark. Now you can select an item from a pull-down menu or click another component of the graphical user interface. The web browser will open directly to the corresponding section of the User's Guide.

---

**Important**

Context-sensitive help is not available on Windows systems.

---

36.12.4. Help/Using Help...

The Help/Using Help... menu item opens the help viewer directly to the section on using the on-line help facility. See Using the GUI Help System (p. 24) for details. For additional information see also, Using Help.

36.12.5. Help/Online Technical Resources...

The Help/Online Technical Resources... menu item opens the web browser to the ANSYS Customer Portal web site where you can search for solutions and log requests. See Using the GUI Help System (p. 24) for details.

36.12.6. Help/License Usage

The Help/License Usage... menu item provide ANSYS Fluent license information. See Using the GUI Help System (p. 24) for details.

36.12.7. Help/Version...

The Help/Version... menu item shows you the version and release of ANSYS Fluent that you are using.

**Beta Features**

ANSYS Fluent contains Beta features that should be used under the supervision of an ANSYS support representative. Information about Beta features can be found on the ANSYS Customer Portal.
Appendix A. ANSYS Fluent Model Compatibility

The following tables summarize the compatibility of several ANSYS Fluent model categories:

- Multiphase Models (see Modeling Multiphase Flows (p. 1243))
- Moving Domain Models (See Modeling Flows with Moving Reference Frames (p. 535))
- Turbulence Models (See Modeling Turbulence (p. 695))
- Combustion Models (See Chapters Modeling Species Transport and Finite-Rate Chemistry (p. 885) – Modeling Engine Ignition (p. 1051))

Note that a ✓ indicates that two models are compatible with each other, while the absence of a ✓ indicates that two models are not compatible with each other.

** Includes Standard and SST $k$–omega models
Appendix B. ANSYS Fluent File Formats

This appendix provides information about the following:
B.1. Case and Data File Formats
B.2. Mesh Morpher/Optimizer File Format
B.3. Shell Conduction Settings File Format

B.1. Case and Data File Formats

This section describes the contents and formats of ANSYS Fluent case and data files. After discussing the Guidelines (p. 2533) and Formatting Conventions in Binary and Formatted Files (p. 2533), the section descriptions are grouped according to function:

- Grid Sections (p. 2534) : Creating grids for ANSYS Fluent.
- Other (Non-Grid) Case Sections (p. 2545)
- Data Sections (p. 2548) : Importing solutions into another postprocessor.

The case and data files may contain other sections that are intended for internal use only.

B.1.1. Guidelines

The ANSYS Fluent case and data files are broken into several sections according to the following guidelines:

- Each section is enclosed in parentheses and begins with a decimal integer indicating its type. This integer is different for formatted and binary files (Formatting Conventions in Binary and Formatted Files (p. 2533)).

- All groups of items are enclosed in parentheses. This makes skipping to ends of (sub)sections and parsing them very easy. It also allows for easy and compatible addition of new items in future releases.

- Header information for lists of items is enclosed in separate sets of parentheses preceding the items, and the items are enclosed in their own parentheses.

B.1.2. Formatting Conventions in Binary and Formatted Files

For formatted files, examples of file sections are given in Grid Sections (p. 2534) and Other (Non-Grid) Case Sections (p. 2545). For binary files, the header indices described in this section (for example, 10 for the node section) are preceded by 20 for single-precision binary data, or by 30 for double-precision binary data (for example, 2010 or 3010 instead of 10). The end of the binary data is indicated by End of Binary Section 2010 or End of Binary Section 3010 before the closing parameters of the section.

An example with the binary data represented by periods is as follows:

(2010 (2 1 2aad 2 3) ( .
  .
  .
  .

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates. 2533
B.1.3. Grid Sections

Grid sections are stored in the case file. A grid file is a subset of a case file, containing only those sections pertaining to the grid. The currently defined grid sections are:

- Comment (See Comment (p. 2534))
- Header (See Header (p. 2535))
- Dimensions (See Dimensions (p. 2535))
- Nodes (See Nodes (p. 2535))
- Periodic Shadow Faces (See Periodic Shadow Faces (p. 2536))
- Cells (See Cells (p. 2537))
- Faces (See Faces (p. 2538))
- Face Tree (See Face Tree (p. 2540))
- Cell Tree (See Cell Tree (p. 2541))
- Interface Face Parents (See Interface Face Parents (p. 2541))

The section ID numbers are indicated in both symbolic and numeric forms. The symbolic representations are available as symbols in a Scheme source file (xfile.scm), which is available from ANSYS Inc., or as macros in a C header file (xfile.h), which is located in your installation area.

B.1.3.1. Comment

Index: 0
Scheme symbol: xf-comment
C macro: XF_COMMENT
Status: optional

Comment sections can appear anywhere in the file (except within other sections) as:

(0 "comment text")

You should precede each long section, or group of related sections, by a comment section explaining what is to follow.

Example:

(0 "Variables:"
 (37 {
    (relax-mass-flow 1)
    (default-coefficient ()
    (default-method 0)
  }))
**B.1.3.2. Header**

Index: 1
Scheme symbol: xf-header
C macro: XF_HEADER
Status: optional

Header sections can appear anywhere in the file (except within other sections). The following is an example:

```
(0 "fluent15.0.0 build-id: 0")
```

The purpose of this section is to identify the program that wrote the file. Although it can appear anywhere, it is one of the first sections in the file. Additional header sections indicate other programs that may have been used in generating the file. It provides a history mechanism showing where the file came from and how it was processed.

**B.1.3.3. Dimensions**

Index: 2
Scheme symbol: xf-dimension
C macro: XF_DIMENSION
Status: optional

The dimensions of the grid appear as:

```
(2 ND)
```

where ND is 2 or 3. This section is supported as a check that the grid has the appropriate dimension.

**B.1.3.4. Nodes**

Index: 10
Scheme symbol: xf-node
C macro: XF_NODE
Status: required

Format:

```
(10 (zone-id first-index last-index type ND)(
  x1 y1 z1
  x2 y2 z2
  .
  .
  .
))
```

- If zone-id is zero, this provides the total number of nodes in the grid. first-index will then be one, last-index will be the total number of nodes in hexadecimal, type is equal to 1, ND is the dimension-
ality of the grid, and there are no coordinates following (the parentheses for the coordinates are omitted as well).

For example: \((10 \ (0 \ 1 \ 2d5 \ 1 \ 2))\)

- If zone-id is greater than zero, it indicates the zone to which the nodes belong. first-index and last-index are the indices of the nodes in the zone, in hexadecimal. The values of last-index in each zone must be less than or equal to the value in the declaration section. Type is always equal to 1.

ND is an optional argument that indicates the dimensionality of the node data, where ND is 2 or 3.

If the number of dimensions in the grid is two, as specified by the node header, then only \(x\) and \(y\) coordinates are present on each line.

The following is an example of a 2D grid:

\[
(10 \ (1 \ 2d5 \ 1 \ 2) \ ( \\
1.500000e-01 \ 2.500000e-02 \\
1.625000e-01 \ 1.250000e-02 \\
. \\
. \\
1.750000e-01 \ 0.000000e+00 \\
2.000000e-01 \ 2.500000e-02 \\
1.875000e-01 \ 1.250000e-02 \\
))
\]

Because the grid connectivity is composed of integers representing pointers (see Cells and Faces), using hexadecimal conserves space in the file and provides for faster file input and output. The header indices are in hexadecimal so that they match the indices in the bodies of the grid connectivity sections. The zone-id and type are also in hexadecimal for consistency.

### B.1.3.5. Periodic Shadow Faces

**Index:** 18  
**Scheme symbol:** xf-periodic-face  
**C macro:** XF_PERIODIC_FACE  
**Status:** required only for grids with periodic boundaries

This section indicates the pairings of periodic faces on periodic boundaries. Grids without periodic boundaries do not have sections of this type. The format of the section is as follows:

\[
(18 \ (first-index \ last-index \ periodic-zone \ shadow-zone) \ ( \\
f00 \ f01 \\
f10 \ f11 \\
f20 \ f21 \\
. \\
. \\
))
\]

where

- first-index = index of the first periodic face pair in the list
- last-index = index of the last periodic face pair in the list
periodic-zone = zone ID of the periodic face zone
shadow-zone = zone ID of the corresponding shadow face zone

These are in hexadecimal format. The indices in the section body (f*) refer to the faces on each of the periodic boundaries (in hexadecimal), the indices being offsets into the list of faces for the grid.

---

**Note**

In this case, first-index and last-index do not refer to face indices. They refer to indices in the list of periodic pairs.

---

**Example:**

```
(18 (1 2b a c) (12 1f 13 21 ad 1c2 . . . ))
```

**B.1.3.6. Cells**

<table>
<thead>
<tr>
<th>Index</th>
<th>Scheme symbol:</th>
<th>C macro:</th>
<th>Status:</th>
</tr>
</thead>
<tbody>
<tr>
<td>12</td>
<td>xf-</td>
<td>XF_CELL</td>
<td>required</td>
</tr>
</tbody>
</table>

The declaration section for cells is similar to that for nodes.

```
(12 (zone-id first-index last-index type element-type))
```

Again, zone-id is zero to indicate that it is a declaration of the total number of cells. If last-index is zero, then there are no cells in the grid. This is useful when the file contains only a surface mesh to alert ANSYS Fluent that it cannot be used. In a declaration section, the type has a value of zero and the element-type is not present.

For example,

```
(12 (0 1 3e3 0))
```

It states that there are 3e3 (hexadecimal) = 995 cells in the grid. This declaration section is required and must precede the regular cell sections.

The element-type in a regular cell section header indicates the type of cells in the section, as follows:

<table>
<thead>
<tr>
<th>element-type</th>
<th>description</th>
<th>nodes/cell</th>
<th>faces/cell</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>mixed</td>
<td>3</td>
<td>3</td>
</tr>
<tr>
<td>1</td>
<td>triangular</td>
<td>4</td>
<td>4</td>
</tr>
<tr>
<td>2</td>
<td>tetrahedral</td>
<td></td>
<td></td>
</tr>
<tr>
<td>element-type</td>
<td>description</td>
<td>nodes/cell faces/cell</td>
<td></td>
</tr>
<tr>
<td>--------------</td>
<td>-------------</td>
<td>-----------------------</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>quadrilateral</td>
<td>4 4</td>
<td></td>
</tr>
<tr>
<td>4</td>
<td>hexahedral</td>
<td>8 6</td>
<td></td>
</tr>
<tr>
<td>5</td>
<td>pyramid</td>
<td>5 5</td>
<td></td>
</tr>
<tr>
<td>6</td>
<td>wedge</td>
<td>6 5</td>
<td></td>
</tr>
<tr>
<td>7</td>
<td>polyhedral</td>
<td>NN NF</td>
<td></td>
</tr>
</tbody>
</table>

where NN and NF will vary, depending on the specific polyhedral cell.

Regular cell sections have no body, but they have a header of the same format where first-index and last-index indicate the range for the particular zone, type indicates whether the cell zone is an active zone (solid or fluid), or inactive zone (currently only parent cells resulting from hanging node adaption). Active zones are represented with type=1, while inactive zones are represented with type=32.

In the earlier versions of ANSYS Fluent, a distinction was made between solid and fluid zones. This is now determined by properties (that is, material type).

A type of zero indicates a dead zone and will be skipped by ANSYS Fluent. If a zone is of mixed type (element-type=0), it will have a body that lists the element-type of each cell.

Example:

```
(12 (9 1 3d 0 0)
  1 1 1 3 3 1 1 3 1
  ...
  ...
)
```

Here, there are 3D (hexadecimal) = 61 cells in cell zone 9, of which the first 3 are triangles, the next 2 are quadrilaterals, and so on.

**B.1.3.7. Faces**

Index: 13  
Scheme symbol: xf-  
C macro: XF_FACE  
Status: required

The format for face sections is as follows:

```
(13 (zone-id first-index last-index bc-type face-type))
```

where

zone-id = zone ID of the face section  
first-index = index of the first face in the list
last-index = index of the last face in the list
bc-type = ID of the boundary condition represented by the face section
face-type = ID of the type(s) of face(s) in the section

The current valid boundary condition types are defined in the following table:

<table>
<thead>
<tr>
<th>bc-type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>interior</td>
</tr>
<tr>
<td>3</td>
<td>wall</td>
</tr>
<tr>
<td>4</td>
<td>pressure-inlet, inlet-vent, intake-fan</td>
</tr>
<tr>
<td>5</td>
<td>pressure-outlet, exhaust-fan, outlet-vent</td>
</tr>
<tr>
<td>7</td>
<td>symmetry</td>
</tr>
<tr>
<td>8</td>
<td>periodic-shadow</td>
</tr>
<tr>
<td>9</td>
<td>pressure-far-field</td>
</tr>
<tr>
<td>10</td>
<td>velocity-inlet</td>
</tr>
<tr>
<td>12</td>
<td>periodic</td>
</tr>
<tr>
<td>14</td>
<td>fan, porous-jump, radiator</td>
</tr>
<tr>
<td>20</td>
<td>mass-flow-inlet</td>
</tr>
<tr>
<td>24</td>
<td>interface</td>
</tr>
<tr>
<td>31</td>
<td>parent (hanging node)</td>
</tr>
<tr>
<td>36</td>
<td>outflow</td>
</tr>
<tr>
<td>37</td>
<td>axis</td>
</tr>
</tbody>
</table>

The faces resulting from the intersection of non-conformal grids are placed in a separate face zone, where a factor of 1000 is added to the bc-type (for example, 1003 is a wall zone).

The current valid face types are defined in the following table:

<table>
<thead>
<tr>
<th>face-type</th>
<th>description</th>
<th>nodes/face</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>mixed</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>linear</td>
<td>2</td>
</tr>
<tr>
<td>3</td>
<td>triangular</td>
<td>3</td>
</tr>
<tr>
<td>4</td>
<td>quadrilateral</td>
<td>4</td>
</tr>
<tr>
<td>5</td>
<td>polygonal</td>
<td>NN</td>
</tr>
</tbody>
</table>

where NN will vary, depending on the specific polygonal face.

A zone-id of zero indicates a declaration section, which provides a count of the total number of faces in the file. Such a section omits the bc-type and is not followed by a body with further information.

A non-zero zone-id indicates a regular face section, and will be followed by a body that contains information about the grid connectivity. Each line of the body will describe one face and will have the following format:
n0 n1 n2 c0 c1

where,

n* = defining nodes (vertices) of the face
c* = adjacent cells

This is the format for a 3D grid with a triangular face format. The actual number of nodes depends on the face-type. The order of the cell indices is important, and is determined by the right-hand rule: if you curl the fingers of your right hand in the order of the nodes, your thumb will point toward c0.

For 2D grids, n2 is omitted. c1 is determined by the cross product of two vectors, \( \hat{r} \) and \( \hat{k} \). The \( \hat{r} \) vector extends from n0 to n1, whereas the \( \hat{k} \) vector has its origin at n0 and points out of the grid plane toward the viewer. If you extend your right hand along \( \hat{r} \) and curl your fingers in the direction of the angle between \( \hat{r} \) and \( \hat{k} \), your thumb will point along \( \hat{r} \times \hat{k} \) toward c1.

If the face zone is of mixed type (face-type = 0) or of polygonal type (face-type = 5), each line of the section body will begin with a reference to the number of nodes that make up that particular face, and has the following format:

\[
x n0 n1 \ldots nf c0 c1
\]

where,

x = the number of nodes (vertices) of the face
nf = the final node of the face

All cells, faces, and nodes have positive indices. If a face has a cell only on one side, then either c0 or c1 is zero. For files containing only a surface mesh, both these values are zero.

For information on face-node connectivity for various cell types in ANSYS Fluent, refer to Face-Node Connectivity in ANSYS Fluent (p. 119).

**B.1.3.8. Face Tree**

**Index:** 59

**Scheme symbol:** xf-face-tree

**C macro:** XF_FACE_TREE

**Status:** only for grids with hanging-node adaptation

This section indicates the face hierarchy of the grid containing hanging nodes. The format of the section is as follows:

```plaintext
(59 (face-id0 face-id1 parent-zone-id child-zone-id)
 (number-of-kids kid-id-0 kid-id-1 \ldots kid-id-n
 .
 .
 . ))
```

where,
face-id0 = index of the first parent face in the section
face-id1 = index of the last parent face in the section
parent-zone-id = ID of the zone containing parent faces
child-zone-id = ID of the zone containing children faces
number-of-kids = the number of children of the parent face
kid-id-n = the face IDs of the children

These are in hexadecimal format.

**B.1.3.9. Cell Tree**

Index: 58
Scheme symbol: xf-cell-tree
C macro: XF_CELL_TREE
Status: only for grids with hanging-node adaptation

This section indicates the cell hierarchy of the grid containing hanging nodes. The format of the section is as follows:

```
(58 (cell-id0 cell-id1 parent-zone-id child-zone-id)
  (number-of-kids kid-id-0 kid-id-1 ... kid-id-n)
  ...
  )
```

where,

cell-id0 = index of the first parent cell in the section
cell-id1 = index of the last parent cell in the section
parent-zone-id = ID of the zone containing parent cells
child-zone-id = ID of the zone containing children cells
number-of-kids = the number of children of the parent cell
kid-id-n = the cell IDs of the children

These are in hexadecimal format.

**B.1.3.10. Interface Face Parents**

Index: 61
Scheme symbol: xf-face-parents
C macro: XF_FACE_PARENTS
This section indicates the relationship between the intersection faces and original faces. The intersection faces (children) are produced from intersecting two non-conformal surfaces (parents) and are some fraction of the original face. Each child will refer to at least one parent. The format of the section is as follows:

```
(61 (face-id0 face-id1)
  (parent-id-0 parent-id-1
   ...
   ))
```

where,

- `face-id0` = index of the first child face in the section
- `face-id1` = index of the last child face in the section
- `parent-id-*` = index of parent faces

These are in hexadecimal format.

If you set up and save a non-conformal mesh in the solution mode of Fluent and then read it using the meshing mode of Fluent, this section will be skipped; consequently, all the information necessary to preserve the non-conformal interface will not be maintained. When you switch to or read the mesh back into the solution mode, you will need to recreate the interface.

**B.1.3.11. Example Files**

**B.1.3.11.1. Example 1**

Figure 1: Quadrilateral Mesh (p. 2542) illustrates a simple quadrilateral mesh with no periodic boundaries or hanging nodes.

B.1.4. Other (Non-Grid) Case Sections

The following sections store boundary conditions, material properties, and solver control settings.

B.1.4.1. Zone
B.1.4.2. Partitions

B.1.4.1. Zone

Index: 39 or 45
There is typically one zone section for each zone referenced by the grid. Although some grid zones may not have corresponding zone sections, there cannot be more than one zone section for each zone.

A zone section has the following form:

```
(39 (zone-id zone-type zone-name domain-id)
  (condition1 . value1)
  (condition2 . value2)
  (condition3 . value3)
  ...
  )
)
```

Grid generators and other preprocessors need only provide the section header and leave the list of conditions empty, as in

```
(39 (zone-id zone-type zone-name domain-id)())
```

The empty parentheses at the end are required. The solver adds conditions as appropriate, depending on the zone type. When only zone-id, zone-type, zone-name, and domain-id are specified, the index 45 is preferred for a zone section. However, the index 39 must be used if boundary conditions are present, because any and all remaining information in a section of index 45 after zone-id, zone-type, zone-name, and domain-id will be ignored.

Here the zone-id is in decimal format. This is in contrast to the use of hexadecimal in the grid sections.

The zone-type is one of the following:

- axis
- exhaust fan
- fan
- fluid
- inlet vent
- intake fan
- interface
- interior
- mass-flow-inlet
- outlet vent
- outflow
- periodic
- porous-jump
- pressure-far-field
- pressure-inlet
- pressure-outlet
- radiator
- shadow
- solid
- symmetry
- velocity-inlet
- wall

The interior, fan, porous-jump, and radiator types can be assigned only to zones of faces inside the domain. The interior type is used for the faces within a cell zone; the others are for interior faces that form infinitely thin surfaces within the domain. ANSYS Fluent allows the wall type to be
assigned to face zones both on the inside and on the boundaries of the domain. Some zone types are valid only for certain types of grid components. For example, cell (element) zones can be assigned only one of the following types:

- fluid
- solid

All of the other types listed above can be used only for boundary (face) zones.

The zone-name is a user-specified label for the zone. It must be a valid Scheme symbol \(^1\) and is written without quotes. The rules for a valid zone-name (Scheme symbol) are as follows:

- The first character must be a lowercase letter \(^2\) or a special-initial.
- Each subsequent character must be a lowercase letter, a special-initial, a digit, or a special-subsequent.

where a special-initial character is one of the following:

\(|\!\$\%\&\(*\)\(/:\<=>\?\~\^|

and a special-subsequent is one of the following:

\(.,+\)

Examples of valid zone names are inlet-port/cold!, eggs/easy, and e=m*c^2.

Some examples of zone sections produced by grid generators and preprocessors are as follows:

\[
(39 (1 fluid fuel 1)())
(39 (8 pressure-inlet pressure-inlet-8 2)())
(39 (2 wall wing-skin 3)())
(39 (3 symmetry mid-plane 1)())
\]

The domain-id is an integer that appears after the zone name, associating the boundary condition with a particular phase or mixture (sometimes referred to as phase-domains and mixture-domains).

**B.1.4.2. Partitions**

<table>
<thead>
<tr>
<th>Index:</th>
<th>40</th>
</tr>
</thead>
<tbody>
<tr>
<td>Scheme symbol:</td>
<td>xf-partition</td>
</tr>
<tr>
<td>C macro:</td>
<td>XF_PARTITION</td>
</tr>
<tr>
<td>Status:</td>
<td>only for partitioned grids</td>
</tr>
</tbody>
</table>

This section indicates each cell's partition. The format of the section is as follows:

\[
(40 (zone-id first-index last-index partition-count)(
p1
p2
p3
.
.
)
\]

---

\(^2\) The Standard actually only requires that case be insignificant; the ANSYS Fluent implementation accomplishes this by converting all uppercase input to lowercase.
where,

\[ p_1 = \text{the partition of the cell whose ID is first-index} \]
\[ p_2 = \text{the partition of the cell whose ID is first-index + 1, etc.} \]
\[ p_n = \text{the partition of the cell whose ID is last-index} \]
\[ \text{partition-count} = \text{the total number of partitions} \]

Partition IDs must be between 0 and one less than \( \text{partition-count} \).

**B.1.5. Data Sections**

The following sections store iterations, residuals, and data field values.

- **B.1.5.1. Grid Size**
- **B.1.5.2. Data Field**
- **B.1.5.3. Residuals**

**B.1.5.1. Grid Size**

| Index: | 33 |
| Scheme symbol: | xf-grid-size |
| C macro: | XF_GRID_SIZE |
| Status: | optional |

This section indicates the number of cells, faces, and nodes in the grid that corresponds to the data in the file. This information is used to check that the data and grid match. The format is

\[
(33 \ (n\text{-elements} \ n\text{-faces} \ n\text{-nodes}))
\]

where the integers are written in decimal.

**B.1.5.2. Data Field**

| Index: | 300 |
| Scheme symbol: | xf-rf-seg-data |
| C macro: | XF_RF_SEG_DATA |
| Status: | required |

This section lists a flow field solution variable for a cell or face zone. The data are stored in the same order as the cells or faces in the case file. Separate sections are written out for each variable for each face or cell zone on which the variable is stored. The format is

\[
(300 \ (\text{sub-section-id} \ \text{zone-id} \ \text{size} \ \text{n-time-levels} \ \text{n-phases} \ \text{first-id} \ \text{last-id}) \\
\text{data-for-cell-or-face with id = first-id} \\
\text{data-for-cell-or-face with id = first-id+1} \\
..)
\]
where \textit{sub-section-id} is a (decimal) integer that identifies the variable field (for example, 1 for pressure, 2 for velocity). The complete list of these is available in the header file (\texttt{xfile.h}), which is located in your installation area.

where,

\textit{zone-id} = the ID number of the cell or face zone

\textit{size} = the length of the variable vector

\textit{zone-id} matches the ID used in case file. \textit{size} is 1 for a scalar, 2 or 3 for a vector, equal to the number of species for variables defined for each species). \textit{n-time-levels} currently are not used.

A sample data file section for the velocity field in a cell zone for a steady-state, single-phase, 2D problem is shown below:

\begin{verbatim}
(300 2 16 2 0 17 100)
(8.08462024e-01 8.11823010e-02
8.78750622e-01 3.15509699e-02
1.06139672e+00 -3.74040119e-02
... 1.33301604e+00 -5.04243895e-02
6.21703446e-01 -2.46118382e-02
4.41687912e-01 -1.27046436e-01
1.03528820e-01 -1.01711005e-01 ))
\end{verbatim}

The variables that are listed in the data file depend on the models active at the time the file is written. Variables that are required by the solver based on the current model settings but are missing from the data file are set to their default values when the data file is read. Any extra variables that are present in the data file but are not relevant according to current model settings are ignored.

\textbf{B.1.5.3. Residuals}

\textbf{Index:} 302

\textbf{Scheme symbol:} xf-\textbf{rf}-scaled-residuals

\textbf{C macro:} XF\_RF\_SCALED\_RESIDUALS

\textbf{Status:} optional

This section lists the values of the residuals for a particular data field variable at each iteration:

\begin{verbatim}
(302 (n residual-section-id size domain-id)
{
iteration_number unscaled_residual scaling_factor
 .
 .
 .
})
\end{verbatim}

where,

\textit{n} = the number of residuals

\textit{size} = the length of the variable vector
residual-section-id = an integer (decimal) indicating the equation

domain-id = domain ID

size is 1 for a scalar, 2 or 3 for a vector, equal to the number of species for variables defined for each species. The residual-section-id indicates the equation for which the residual is stored in the section, according to the C constants defined in a header file (xfile.h) available in your installation area, as noted in Grid Sections (p. 2534).

The equations for which residuals are listed in the data file depend on the models active at the time the file is written. If the residual history is missing from the data file for a currently active equation, it is initialized with zeros.

B.2. Mesh Morpher/Optimizer File Format

This section describes the format of the ASCII text files that can define the scaling factor settings for the mesh morpher/optimizer, as described in Setting Up the Mesh Morpher/Optimizer (p. 676). The following is an example of such a file:

```
Reg   CP   Par   X   Y   Z
def-0 2   par1  -1  0   0
def-0 4   par1  2  -1  3
def-0 2   par2  0   1  0
def-1 2   par3  0   0  1
def-1 3   par1  2   0  2
```

When creating or editing a file that defines the scaling factor settings for the mesh morpher/optimizer, note the following:

• The file can be created from scratch using a text editor or spreadsheet program, as long as it adheres to the format described in this section. An easier alternative is to apply some sample scaling factor definitions using the Settings group box in the Deformation tab of the Mesh Morpher/Optimizer Dialog Box (p. 2417), generate a file using the Write to File... button, and then edit the file using a text editor or spreadsheet program.

• The file must be a tab-delimited ASCII text file.

• The first line contains the column headings shown in the previous example, and then each of the lines that follow define what deformation parameter and scaling factors are assigned to a control point of a deformation region. Starting from the left and proceeding to the right, the columns define the deformation region, the control point, the parameter, and the scaling factors that will be applied in the x, y, and z directions, respectively.

• The names of the deformation regions (for example, def-0) and deformation parameters (for example, par1) must correspond to those that exist in the intended case file.

• The control point numbers must range between 1 and the maximum number of available control points in the intended case file.

• The scaling factors that will be applied in the x, y, and z directions can be any real numbers.

B.3. Shell Conduction Settings File Format

This section describes the format of the CSV files that can define shell conduction settings, as described in Managing Shell Conduction Walls (p. 772). The following is an example of such a file:
When creating or editing a file that defines the shell conduction settings, note the following:

- The file can be created from scratch using a text editor or spreadsheet program, as long as it adheres to the format described in this section. An easier alternative is to apply some sample shell conduction definitions using the Shell Conduction Manager Dialog Box (p. 2445), generate a file using the Write... button, and then edit the file using a text editor or spreadsheet program.

- The file must be a comma-delimited ASCII file.

- The first line contains the column headings shown in the previous example, and then each of the subsequent lines define the settings for a layer.

- The zone IDs, zone names, layer numbers, and materials (for example, wall-1, substrate) must correspond to those that exist in the intended case file.

- The layer thicknesses must be positive, non-zero values.

Nomenclature

Le \quad \text{Lewis number} \equiv \text{ratio of thermal diffusivity to mass diffusivity (dimensionless)}

m \quad \text{Mass (g, kg, lb)}

\dot{m} \quad \text{Mass flow rate (kg/s, lb/s)}

M_W \quad \text{Molecular weight (kg/kmol, lb/lb mol)}

M \quad \text{Mach number} \equiv \text{ratio of fluid velocity magnitude to local speed of sound (dimensionless)}

Nu \quad \text{Nusselt number} \equiv \text{dimensionless heat transfer or mass transfer coefficient (dimensionless); usually a function of other dimensionless groups}

p \quad \text{Pressure (Pa, atm, mm Hg, lb/ft}^2\text{)}

Pe \quad \text{Peclet number} \equiv Re \times Pr \text{ for heat transfer, and } \equiv Re \times Sc \text{ for mass transfer (dimensionless)}

Pr \quad \text{Prandtl number} \equiv \text{ratio of momentum diffusivity to thermal diffusivity (dimensionless)}

Q \quad \text{Flow rate of enthalpy (W, Btu/h)}

q \quad \text{Heat flux (W/m}^2\text{, Btu/ft}^2\text{-h)}

R \quad \text{Gas-law constant (8.31447 \times 10^3 J/kmol-K, 1.98588 Btu/lb mol-}^\circ\text{F)}

r \quad \text{Radius (m, ft)}

\mathcal{R} \quad \text{Reaction rate (units vary)}

Ra \quad \text{Rayleigh number} \equiv Gr \times Pr; \text{ measure of the strength of buoyancy-induced flow in natural (free) convection (dimensionless)}

Re \quad \text{Reynolds number} \equiv \text{ratio of inertial forces to viscous forces (dimensionless)}

S \quad \text{Total entropy (J/K, J/kmol-K, Btu/lb mol-}^\circ\text{F)}

s \quad \text{Species entropy; } s^0, \text{ standard state entropy (J/kmol-K, Btu/lb mol-}^\circ\text{F)}

Sc \quad \text{Schmidt number} \equiv \text{ratio of momentum diffusivity to mass diffusivity (dimensionless)}

S_{ij} \quad \text{Mean rate-of-strain tensor (s}^{-1}\text{)}

T \quad \text{Temperature (K, }^\circ\text{C, }^\circ\text{R, }^\circ\text{F)}

t \quad \text{Time (s)}

U \quad \text{Free-stream velocity (m/s, ft/s)}

u, v, w \quad \text{Velocity magnitude (m/s, ft/s); also written with directional subscripts (for example, } v_x, v_y, v_z\text{)}

V \quad \text{Volume (m}^3\text{, ft}^3\text{)}

\overline{v} \quad \text{Overall velocity vector (m/s, ft/s)}

We \quad \text{Weber number} \equiv \text{ratio of aerodynamic forces to surface tension forces (dimensionless)}

X \quad \text{Mole fraction (dimensionless)}

Y \quad \text{Mass fraction (dimensionless)}

\alpha \quad \text{Permeability, or flux per unit pressure difference (L/m}^2\text{-atm, ft}^3\text{/ft}^2\text{-h-(lb/ft}^2\text{))}

\alpha \quad \text{Thermal diffusivity (m}^2\text{/s, ft}^2\text{/s)}

\alpha \quad \text{Volume fraction (dimensionless)}
\( \beta \)  
Coefficient of thermal expansion \( (K^{-1}) \)

\( \gamma \)  
Porosity (dimensionless)

\( \gamma \)  
Ratio of specific heats, \( c_p/c_v \) (dimensionless)

\( \Delta \)  
Change in variable, final — initial (for example, \( \Delta p, \Delta t, \Delta H, \Delta S, \Delta T \))

\( \delta \)  
Delta function (units vary)

\( \varepsilon \)  
Emissivity (dimensionless)

\( \varepsilon \)  
Lennard-Jones energy parameter (J/molecule)

\( \varepsilon \)  
Turbulent dissipation rate (m \(^2\)/s, ft \(^2\)/s \(^3\))

\( \varepsilon \)  
Void fraction (dimensionless)

\( \eta \)  
Effectiveness factor (dimensionless)

\( \eta' \), \( \eta'' \)  
Rate exponents for reactants, products (dimensionless)

\( \theta_r \)  
Radiation temperature (K)

\( \lambda \)  
Molecular mean free path (m, nm, ft)

\( \lambda \)  
Wavelength (m, nm, Å, ft)

\( \mu \)  
Dynamic viscosity (cP, Pa-s, lb \( m/ft \)-s)

\( \nu \)  
Kinematic viscosity (m \(^2\)/s, ft \(^2\)/s)

\( \nu' \), \( \nu'' \)  
Stoichiometric coefficients for reactants, products (dimensionless)

\( \rho \)  
Density (kg/m \(^3\), lb \( m/ft \)-\(^3\))

\( \sigma \)  
Stefan-Boltzmann constant \((5.67 \times 10^{-8} \text{ W/m}^2\text{-K}^4)\)

\( \sigma \)  
Surface tension (kg/m, dyn/cm, lb \( f/ft \))

\( \sigma_s \)  
Scattering coefficient (m \(^{-1}\))

\( \bar{\tau} \)  
Stress tensor (Pa, lb \( f/ft \)-\(^2\))

\( \tau \)  
Shear stress (Pa, lb \( f/ft \)-\(^2\))

\( \tau \)  
Time scale, for example, \( \tau_s, \tau_p, \tau_c \) (s)

\( \tau \)  
Tortuosity, characteristic of pore structure (dimensionless)

\( \phi \)  
Equivalence ratio (dimensionless)

\( \phi \)  
Thiele modulus (dimensionless)

\( \Omega \)  
Angular velocity; \( \Omega_{ij} \) Mean rate of rotation tensor (s \(^{-1}\))

\( \omega \)  
Specific dissipation rate (s \(^{-1}\))

\( \Omega, \Omega' \)  
Solid angle (degrees, radians, gradians)

\( \Omega_D \)  
Diffusion collision integral (dimensionless)
